hereby incorporated by reference.

**BACKGROUND OF THE INVENTION**

This invention relates to compounds that inhibit the activity of protein kinases.  
10 Protein kinases are enzymes that catalyze the transfer of a phosphate group from  
ATP to an amino acid residue, such as tyrosine, serine, threonine, or histidine on a  
protein. Regulation of these protein kinases is essential for the control of a wide  
variety of cellular events including proliferation and migration. Specific protein  
kinases have been implicated in diverse conditions including cancer [Blume-Jensen,  
15 P., *Nature*, 411, 355 (2001)) Traxler, P. M., *Exp. Opin. Ther. Patents*, 8, 1599 (1998);  
Bridges, A. J., *Emerging Drugs*, 3, 279 (1998)]; restenosis [Mattsson, E., *Trends  
Cardiovascular Medicine* 5, 200 (1995)]; atherosclerosis [Raines, E. W., *Bioessays*,  
18, 271 (1996)]; angiogenesis [Shawver, L. K., *Drug Discovery Today*, 2, 50 (1997);  
Folkman, J., *Nature Medicine*, 1, 27 (1995)] stroke [Paul, R., *Nature Medicine* 7, 222  
20 (2001)]; and osteoporosis [Boyce, *J. Clin. Invest.*, 90, 1622 (1992)].

Tyrosine kinases (TK) are a class of protein kinases. The major family of  
cytoplasmic protein TKs is the Src family which consists of at least eight members  
(Src, Fyn, Lyn, Yes, Lck, Fgr, Hck and Blk) that participate in a variety of signaling  
pathways [Schwartzberg, P. L., *Oncogene*, 17, 1463 (1998)]. The prototypical  
25 member of this tyrosine kinase family is Src, which is involved in proliferation and  
migration responses in many cell types [Sawyer, T., *Expert Opin. Investig. Drugs*, 10,  
1327 (2001)]. Src activity has been shown to be elevated in breast, colon (~90%),  
pancreatic (>90%) and liver (>90%) tumors. Greatly increased Src activity is also  
associated with metastasis (>90%) and poor prognosis. Antisense Src message  
30 impedes growth of colon tumor cells in nude mice [Staley, C. A., *Cell Growth  
Differentiation*, 8, 269 (1997)], suggesting that Src inhibitors could slow tumor growth.  
In addition to its role in cell proliferation, Src also acts in stress response pathways,  
including the hypoxia response. Nude mice studies with colon tumor cells expressing

antisense Src message have reduced vascularization [Ellis, L. M., *J. Biol. Chem.*, 273, 1052 (1998)], which suggests that Src inhibitors could be anti-angiogenic as well as anti-proliferative.

5 Src disrupts E-cadherin associated cell-cell interactions [E. Avezienyte, *Nature Cell Bio.*, 4, 632 (2002)]. A low molecular weight Src inhibitor prevents this disruption thereby reducing cancer cell metastasis [Nam, J.S., *Clinical Cancer Res.*, 8, 2340 (2002)].

Src inhibitors may prevent the secondary injury that results from a VEGF-mediated increase in vascular permeability such as that seen following stroke  
10 [Eliceiri, B. P., *Mol. Cell.*, 4, 915 (1999); Paul, R., *Nat. Med.* 7, 222 (2001)].

Src also plays a role in osteoporosis. Mice genetically engineered to be deficient in Src production were found to exhibit osteopetrosis, the failure to resorb bone [Soriano, P., *Cell*, 64, 693 (1991); Boyce, B. F., *J. Clin. Invest.*, 90, 1622 (1992)]. This defect was characterized by a lack of osteoclast activity. Since  
15 osteoclasts normally express high levels of Src, inhibition of Src kinase activity may be useful in the treatment of osteoporosis [Missbach, M., *Bone*, 24, 437 (1999)].

Inhibitors of the NMDA (N-methyl-D-aspartate) receptor could provide treatment of chronic neuropathic pain [Urban, L. *Drug Dev. Res.*, 54, 159 (2002)]. The activity of NMDA receptors is regulated by Src family kinases (SFKs) (Yu, X. M., *Proc. Nat. Acad. Sci., U.S.A.*, 96, 7697 (1999) and a low molecular weight SFK inhibitor, PP2,  
20 decreases phosphorylation of the NMDA receptor NR2 subunit [Guo, W.J. *Neuro.*, 22(14), 6208 (2002)]. SFK inhibitors therefore have potential in the treatment of neuropathic pain.

Tyrosine kinases (TKs) are divided into two classes: the non-transmembrane  
25 TKs and transmembrane growth factor receptor TKs (RTKs) [Blume-Jensen, P., *Nature*, 411, 355 (2001)]. Growth factors, such as epidermal growth factor (EGF), bind to the extracellular domain of their partner RTK on the cell surface which activates the RTK, initiating a signal transduction cascade that controls a wide variety of cellular responses including proliferation and migration. The overexpression of  
30 EGF and also of members of the epidermal growth factor receptor (EGFr) family,

which includes EGF-r, erbB-2, erbB-3 and erbB-4, is implicated in the development and progression of cancer [Rusch, V., *Cytokine Growth Factor Rev.*, 7, 133 (1996), Davies, D. E., *Biochem. Pharmacol.*, 51, 1101 (1996) and Modjtahedi, E., *Int. J. Oncol.*, 4, 277 (1994)]. Specifically, over expression of the receptor kinase product of

5 the erbB-2 oncogene has been associated with human breast and ovarian cancers [Slamon, D. J., *Science*, 244, 707 (1989) and Slamon, D. J., *Science*, 235, 177 (1987)]. Upregulation of EGFr kinase activity has been associated with epidermoid tumors [Reiss, M., *Cancer Res.*, 51, 6254 (1991)]; breast tumors [Macias, A., *Anticancer Res.*, 7, 459 (1987)]; and tumors involving other major organs [Gullick,

10 W.J., *Brit. Med. Bull.*, 47, 87 (1991)].

It is also known that deregulation of EGF receptors is a factor in the growth of epithelial cysts in the disease described as polycystic kidney disease [Du, J., *Amer. J. Physiol.*, 269 (2 Pt 1), 487 (1995); Nauta, J., *Pediatric Res.*, 37(6), 755 (1995); Gattone, V. H., *Developmental Biology*, 169(2), 504 (1995); Wilson, P. D., *Eur. J.*

15 *Cell Biol.*, 61(1), 131, (1993)]. The compounds of this invention, which inhibit the catalytic function of the EGF receptors, are consequently useful for the treatment of this disease.

In addition to EGFr, there are several other RTKs including FGFr, the receptor for fibroblast growth factor (FGF); flk-1, also known as KDR, and flt-1, the

20 receptors for vascular endothelial growth factor (VEGF); and PDGFr, the receptor for platelet derived growth factor (PDGF). The formation of new blood vessels, a process known as angiogenesis, is essential for tumor growth. Two natural angiogenesis inhibitors, angiostatin and endostatin, dramatically inhibited the growth of a variety of solid tumors. [O'Reilly, M. S., *Cell*, 79, 315 (1994); O'Reilly, M. S.,

25 *Nature Medicine*, 2, 689 (1996); O'Reilly, M. S., *Cell*, 88, 277 (1997)]. Since FGF and VEGF are known to stimulate angiogenesis, inhibition of the kinase activity of their receptors should block the angiogenic effects of these growth factors. In addition, the receptor tyrosine kinases tie-1 and tie-2 also play a key role in angiogenesis [Sato, T. N., *Nature*, 376, 70 (1995)]. Compounds of the invention that

30 inhibit the kinase activity of FGFr, flk-1, flt-1, tie-1 or tie-2 may inhibit tumor growth by their effect on angiogenesis.

PDGF is a potent growth factor and chemoattractant for smooth muscle cells (SMCs). The renarrowing of coronary arteries following angioplasty is due in part to the enhanced proliferation of SMCs in response to increased levels of PDGF. Therefore, compounds that inhibit the kinase activity of PDGFr may be useful in the treatment of restenosis. In addition, since PDGF and PDGFr are overexpressed in several types of human gliomas, small molecules capable of suppressing PDGFr activity, have potential utility as anticancer therapeutics [Nister, M., *J. Biol. Chem.* 266, 16755 (1991); Strawn, L. M., *J. Biol. Chem.* 269, 21215 (1994)].

Other RTKs that could potentially be inhibited by compounds of this invention include colony stimulating factor receptor, the nerve growth factor receptors (trka, trkB and trkC), the insulin receptor, the insulin-like growth factor receptor, the hepatocyte growth factor receptor and the erythropoietin-producing hepatic cell receptor (EPH).

In addition to the RTKs there is another family of TKs termed the cytoplasmic protein or non-receptor TKs. The cytoplasmic protein TKs have intrinsic kinase activity, are present in the cytoplasm and nucleus, and participate in diverse signaling pathways. There are a large number of non-receptor TKs including Abl, Jak, Fak, Syk, Zap-70 and Csk. Inhibitors of Abl kinase are useful for the treatment of chronic myeloid leukemia as evidenced by STI-571, marketed as Gleevec [Kantarjian, H., *N. Engl. J. Med.*, 346 (9), 645 (2110)].

Two members of the cytoplasmic protein TKs, lck and ZAP-70 are predominately expressed on T-cells and natural killer (NK) cells. Inhibitors of these kinases can suppress the immune system and therefore have possible therapeutic potential to treat autoimmune diseases such as rheumatoid arthritis, sepsis, and transplant rejection [Kamens, J. S., *Current Opin. Investig. Drugs*, 2, 1213 (2001); Myers, M., *Current Pharm. Design*, 3, 473 (1997)]. A low molecular weight Lck inhibitor is effective in preventing allograft rejection [Waegell, W. *Transplant. Proceed.* 34. 1411 (2002).

Besides TKs, there are additional kinases including those that phosphorylate serine and/or threonine residues on proteins. A major pathway in the cellular signal transduction cascade is the mitogen-activated protein kinase (MAPK) pathway which

consists of the MAP kinase kinases (MAPKK), including mek, and their substrates, the MAP kinases (MAPK), including erk [Seger, R., *FASEB*, 9, 726 (1995)]. When activated by phosphorylation on two serine residues by upstream kinases, such as members of the raf family, mek catalyzes the phosphorylation of threonine and tyrosine residues on erk. The activated erk then phosphorylates and activates both transcription factors in the nucleus and other cellular targets. Over-expression and/or over-activation of mek or erk is associated with various human cancers [Sivaraman, V. S., *J. Clin. Invest.*, 99, 1478 (1997)].

As mentioned above, members of the raf family of kinases phosphorylate serine residues on mek. There are three serine/threonine kinase members of the raf family known as a-raf, b-raf and c-raf. While mutations in the raf genes are rare in human cancers, c-raf is activated by the ras oncogene which is mutated in a wide number of human tumors. Therefore inhibition of the kinase activity of c-raf may provide a way to prevent ras mediated tumor growth [Campbell, S. L., *Oncogene*, 17, 1395 (1998)].

The cyclin-dependent kinases (cdks), including cdc2/cyclin B, cdk2/cyclin A, cdk2/cyclin E and cdk4/cyclin D, and others, are serine/threonine kinases that regulate mammalian cell division. Increased activity or activation of these kinases is associated with the development of human tumors [Garrett, M. D., *Current Opin. Genetics Devel.*, 9, 104 (1999); Webster, K. R., *Exp. Opin. Invest. Drugs*, 7, 865 (1998)]. Additional serine/threonine kinases include PDK1, SGK and the protein kinases A, B, and C, known as PKA or cyclic AMP-dependent protein kinase, PKB (Akt), and PKC, of which all three play key roles in signal transduction pathways responsible for oncogenesis [Glazer, R. I., *Current Pharm. Design*, 4(3), 277 (1998)]. Compounds capable of inhibiting the kinase activity of mek, erk, raf, cdc2/cyclin B, cdk2/cyclin A, cdk2/cyclin E, cdk4/cyclin D, PDK1, SGK, PKA, PKB (Akt) or PKC may be useful in the treatment of diseases characterized by abnormal cellular proliferation, such as cancer.

The serine/threonine kinase UL97 is a virion-associated protein kinase which is required for the replication of human cytomegalovirus [Wolf, D.G., *Arch. Virology* 143(6), 1223 (1998) and He, Z., *J. Virology*, 71, 405(1997)]. Compounds capable of

inhibiting the kinase activity of UL97 may be useful antiviral therapeutics. Since certain bacteria require the action of a histidine kinase for proliferation [Loomis, W. F., *J. Cell Sci.*, 110, 1141 (1997)], compounds capable of inhibiting such histidine kinase activity may be useful antibacterial agents.

- 5 Thieno[3,2-b]pyridines, thieno[2,3-b]pyridines and certain pyridine and pyrimidine derivatives have been noted as kinase inhibitors. These compounds differ both in nature and placement of substituents at various positions when compared to the compounds of this invention.

#### SUMMARY OF THE INVENTION

- 10 This invention relates to thieno[3,2-b]pyridine-6-carbonitrile and thieno[2,3-b]pyridine-5-carbonitrile compounds as well as their pharmaceutically acceptable salts of Formula Ia and Ib:

R<sup>9</sup> is -R<sup>4</sup> or -F;

Y is -C(O)-, -C(O)O-, -OC(O)-, -C(O)NH-, -NHC(O)-, -NHSO<sub>2</sub>-, -SO<sub>2</sub>NH-, -C(OH)H-, -X(C(R<sup>9</sup>)<sub>2</sub>)<sub>q</sub>-, -(C(R<sup>9</sup>)<sub>2</sub>)<sub>q</sub>-, -(C(R<sup>9</sup>)<sub>2</sub>)<sub>q</sub>X-, -C≡C-, *cis*- and *trans*-CH=CH- and cycloalkyl of 3-10 carbon atoms;

- 25 Q is NZZ' wherein Z and Z' may be the same or different and may be H, alkyl of 1 to 6 carbon atoms, alkenyl of 2-6 carbon atoms, alkynyl of 2-6 carbon atoms, aryl, or heteroaryl, and

Z and Z' taken together with the nitrogen to which they are attached may form a heterocyclic ring which may have an additional heteroatom selected from nitrogen, oxygen, and sulfur, and may comprise morpholine, piperazine, piperidine, optionally substituted with -R<sup>4</sup> on a carbon or a nitrogen, or on nitrogen by a group -  
 5 (C(R<sup>9</sup>)<sub>2</sub>)<sub>n</sub>XR<sup>3</sup>, -C(R<sup>9</sup>)<sub>2</sub>)<sub>n</sub>NZ''Z''', or on carbon by a group -(C(R<sup>9</sup>)<sub>2</sub>)<sub>q</sub>XR<sup>3</sup>, -  
 (C(R<sup>9</sup>)<sub>2</sub>)<sub>q</sub>NZ''Z'''',

Z'' and Z''' taken together with the nitrogen to which they are attached may form a heterocyclic ring which may contain an additional heteroatom selected from nitrogen, oxygen and sulfur; Z''' and Z'' may be H, alkyl of 1 to 6 carbon atoms alkenyl of 2-6  
 10 carbon atoms, alkynyl of 2-6 carbon atoms, aryl, or heteroaryl; and

R<sup>1</sup> may be for example a phenyl ring optionally substituted with one to four substituents selected from the group consisting of -J, -CF<sub>3</sub>, -OCF<sub>3</sub>, -R<sup>4</sup>, -OR<sup>4</sup>. and YR<sup>7</sup>; and R<sup>7</sup> is an aryl or heteraryl ring, optionally substituted with one to four substituents selected from the group consisting of -H, -J, -CF<sub>3</sub>, -OCF<sub>3</sub>, -R<sup>4</sup> and OR<sup>4</sup>

15 In particular R<sup>1</sup> may be a phenyl ring optionally substituted with one to four substituents selected from the group consisting of -Cl, -R<sup>4</sup> and -OR<sup>4</sup>.

An example of X is NH.

R<sup>4</sup> may be for example alkyl of 1-6 carbon atoms.

An example of R<sup>2</sup> is R<sup>3</sup> where R<sup>3</sup> is substituted aryl or heteroaryl, wherein the  
 20 substituent on R<sup>3</sup> may be one or more groups selected from -(C(R<sup>9</sup>)<sub>2</sub>)<sub>q</sub>Q; e.g., wherein q is 1 to 3 and/or wherein R<sup>9</sup> is H. Q may be for example NZZ' wherein Z and Z' may be the same or different and may be H, alkyl of 1 to 6 carbon atoms; or Z and Z' taken together with the nitrogen to which they are attached may form a heterocyclic ring which may have an additional heteroatom selected from nitrogen  
 25 and oxygen, said ring may be substituted on nitrogen or carbon by R<sup>4</sup> or on carbon by (CH<sub>2</sub>)<sub>2</sub>OH.

In some embodiments an example of R<sup>2</sup> is R<sup>3</sup> where R<sup>3</sup> is alkynyl of 2-6 carbon atoms, aryl or heteroaryl; which groups may be substituted by one or more groups selected from

- 20 For purposes of this invention a heteroaryl is an aromatic heterocyclic ring system of one to three fused rings. The heteroaryl moieties are five or six membered rings containing 1 to 4 heteroatoms selected from the group consisting of S, N, and O; e.g. heteroaryl may have 5 to 14 ring members. One ring of the ring system may be fully unsaturated, partially saturated, or fully saturated. The heteroaryl moieties include, but are not limited to, thiophene, furan, pyrrole, pyrazole, imidazole, 1,2,3-  
25 triazole, 1,2,4-triazole, tetrazole, thiazole, oxazole, isothiazole, isoxazole, 1,3,4-oxadiazole, 1,2,4-oxadiazole, 1,3,4-thiadiazole, pyridine, pyrimidine, pyrazine, pyridazine, 1,3,5-triazine, morpholine, thiomorpholine, thiomorpholine-S-oxide,

thiomorpholine-S,S-dioxide, piperidine, piperazine, pyrrolidine, aziridine, oxirane, tetrahydrothiophene, tetrahydrofuran, 1,2-pyran, 1,4-pyran, dioxane, 1,3-dioxolane, tetrahydropyran, naphthalene, 1,2,3,4-tetrahydronaphthalene, indan, indene, isoindene, indole, 2,3-dihydroindole, 2-indazole, isoindazole, quinoline, isoquinoline, 5 tetrahydroquinoline, benzofuran, benzothiophene, benzimidazole, benzotriazole, benzothiazole, benzoxazole, benzisoxazole, 1,2-benzopyran, cinnoline, phthalazine, quinazoline, 1,8-naphthyridine, pyrido[3,2-b]pyridine, pyrido[3,4-b]pyridine, pyrido[4,3-b]pyridine, pyrido[2,3-d]pyrimidine, purine, and pteridine. The heteroaryl may be oxidized on a nitrogen atom to provide the corresponding N-oxide, such as 10 pyridine-N-oxide or quinoline -N-oxide. The heteroaryl may also be oxidized on a tri-substituted nitrogen atom to provide the corresponding N-oxide, such as N-ethylpiperazine-N-oxide. In another embodiment the heteroaryl may contain a carbonyl group on one of the carbon atoms, such as pyrrolidinone, 1,3,4-oxadiazol-2-one, or 2-indanone.

15 For purposes of this invention "alkyl" includes both straight and branched alkyl moieties, preferably of 1-6 carbon atoms and includes iso-propyl, n-butyl and the like.

For purposes of this invention the term "cycloalkyl" refers to alicyclic hydrocarbon groups of 3-7 carbon atoms and includes a simple carbocycle as well as 20 a carbocycle containing an alkyl substituent, for example, cyclopropyl, cyclohexyl, adamantyl and the like.

For purposes of this invention the term "aryl" is defined as an aromatic hydrocarbon moiety and may be substituted or unsubstituted and may contain for example 6-14 carbon atoms and have one to three rings. An aryl may be selected 25 from but not limited to, the group: phenyl or biphenyl and may be optionally mono-, di-, tri- or tetra-substituted with substituents selected from, but not limited to, the group consisting of alkyl, acyl, alkoxycarbonyl, alkoxy, alkoxyalkyl, alkoxyalkoxy, cyano, halogen, hydroxy, or nitro.

For purposes of this invention "alkenyl" is defined as a radical aliphatic 30 hydrocarbon that contains at least one carbon-carbon double bond and includes both straight and branched carbon chains of 2-6 carbon atoms in all possible

configurational isomers, for example *cis* and *trans*, and includes ethenyl, 3-hexen-1-yl and the like.

For purposes of this invention "alkynyl" includes both straight or branched carbon chain of 2-6 carbon atoms that contains at least one carbon-carbon triple bond and includes propenyl and the like.

In one embodiment of this invention the alkyl, alkenyl and alkynyl groups can be substituted with such substituents as phenyl, substituted phenyl, hydroxy, halogen, alkoxy, thioalkyl, carboxy, alkoxycarbonyl and acyl.

For purposes of this invention "alkoxy" comprises a group of 1-6 carbon atoms having an alkyl group attached to an oxygen atom and includes methoxy, t-butoxy and also includes polyethers such as  $-O-(CH_2)_2OCH_3$ . A thioalkyl group of 1-6 carbon atoms is defined as an alkyl group attached to a sulfur atom and includes methylthio and the like. A carboxy group is defined as  $-C(O)OH$ , and an alkoxycarbonyl group is defined as  $-C(O)OR$  where R is a group of 1-6 carbon atoms and includes methoxycarbonyl, allyloxycarbonyl and the like. An acyl group is defined as a group  $-C(O)R$  where R is an aliphatic (e.g., alkyl) or aryl radical and includes acetyl, trifluoroacetyl, benzoyl and the like.

The compounds of this invention may include a "divalent group" defined herein as a linking group, for example,  $CH_2CH_2$ .

The compounds of this invention may contain one or more asymmetric carbon atoms and may thus give rise to stereoisomers, such as enantiomers and diastereomers. While shown without respect to stereochemistry in Formulas (Ia) - (If), the present invention includes all the individual possible stereoisomers; as well as the racemic mixtures and other mixtures of R and S stereoisomers (scalemic mixtures which are mixtures of unequal amounts of enantiomers) and pharmaceutically acceptable salts thereof. It should be noted that stereoisomers of the invention having the same relative configuration at a chiral center may nevertheless have different R and S designations depending on the substitution at the indicated chiral center. Some of the compounds of this invention may contain

one or more double bonds; in such cases, the compounds of this invention include each of the possible configurational isomers as well as mixtures of these isomers.

Pharmaceutically acceptable salts of the compounds of Formulas (Ia) - (If) with an acidic moiety can be formed from organic and inorganic bases. For example  
 5 alkali metal salts: sodium, lithium, or potassium and N- tetraalkylammonium salts such as N-tetrabutylammonium salts. Similarly, when a compound of this invention contains a basic moiety, salts can be formed from organic and inorganic acids. For example salts can be formed from acetic, propionic, lactic, citric, tartaric, succinic, fumaric, maleic, malonic, mandelic, malic, phthalic, hydrochloric, hydrobromic,  
 10 phosphoric, nitric, sulfuric, methanesulfonic, naphthalenesulfonic, benzenesulfonic, toluenesulfonic, camphorsulfonic, and similarly known acceptable acids.

This invention provides a process of producing a compound of Formula (Ia) and Formula (Ib) as defined herein or a pharmaceutically acceptable salt thereof, which comprises one of the following

15 a) reacting a compound of formula:

or an S-oxide or S-dioxide thereof; wherein R<sup>2</sup> is as defined herein with a  
 20 compound of formula R<sup>1</sup>XH where R<sup>1</sup> and X are as defined herein to give a compound of formula I(a) or (1b);

or

25 b) reacting a compound of formula 1a or 1b or an S-oxide or S-dioxide thereof in which R<sup>2</sup> is a reactive substituent group to give a compound of formula 1a or 1b in which R<sup>2</sup> is a different substituent group as defined herein;

or

c) converting a compound of formula (1a) or (1b) to a pharmaceutically acceptable salt thereof.

This invention also provides a process of producing a compound of Formula  
5 (1a) and Formula (1b),

wherein R<sup>2</sup> is iodine, comprising:

10 a. treating with a base, in an inert solvent at reduced temperature a compound of Formula (a) or (a'); and

15 b. adding iodine to the compound in step (a) to form a compound of Formula (b) or (b'); and

- c. adding a compound of formula  $R^1XH$  to the compound in step (b) to form a compound of Formula (Ia) or (Ib), wherein  $R^2$  is iodine.

5 This invention includes a compound of Formula (b) or (b')

10 This invention also provides a process of producing a compound of Formula (Ia) or (Ib)

wherein  $R^2$  is bromine, comprising:

- a. treating with a base, in an inert solvent at reduced temperature a compound of Formula (a) or (a'); and

5

- b. adding bromine or 1,1-dibromo-1,1,2,2-tetrafluoroethane to the compound in step (a) to form a compound of Formula (z) or (z'); and

- c. adding a compound of formula  $R^1XH$  to the compound in step (b) to form a compound of Formula (Ia) or (Ib), wherein  $R^2$  is bromine.

10

This invention includes a compound of Formula (z) or (z')

The above-identified processes are explained in greater detail under the  
 5 "Detailed Description of the Invention".

In a preferred embodiment of this invention an inert solvent is a compound that does not react chemically with the compounds of this invention. A preferred inert solvent includes for example tetrahydrofuran (THF).

For purposes of this invention a reduced temperature is a temperature  $\leq 0^{\circ}\text{C}$   
 10 In a preferred embodiment this temperature is  $-78$  to  $0^{\circ}\text{C}$ .

For purposes of this invention an elevated temperature is a temperature of about  $50^{\circ}\text{C}$  to about  $150^{\circ}\text{C}$ .

In another embodiment, the present invention provides a method for the treatment or inhibition of a pathological condition or disorder in a mammal. The  
 15 present invention accordingly provides to a mammal, a pharmaceutical composition that comprises a compound of this invention in combination or association with a pharmaceutically acceptable carrier. The compound of this invention may be provided alone or in combination with other therapeutically effective compounds or therapies for the treatment or prevention of a pathological condition or disorder in a  
 20 mammal.

The compounds are preferably provided orally or subcutaneously. The compounds may be provided by intralesional, intraperitoneal, intramuscular or

intravenous injection; infusion; liposome-mediated delivery; topical; nasal; anal; vaginal; sublingual; urethral; transdermal; intrathecal; ocular; or otic delivery. In order to obtain consistency in providing the compound of this invention it is preferred that a compound of the invention is in the form of a unit dose. Suitable unit dose forms include tablets, capsules and powders in sachets or vials. Such unit dose forms may contain from 0.1 to 100 mg of a compound of the invention and preferably from 2 to 50 mg. Still further preferred unit dosage forms contain 5 to 25 mg of a compound of the present invention. The compounds of the present invention can be administered orally at a dose range of about 0.01 to 5 g/kg or preferably at a dose range of 0.1 to 1 g/kg. Such compounds may be administered from 1 to 6 times a day, more usually from 1 to 4 times a day. The effective amount will be known to one of skill in the art; it will also be dependent upon the form of the compound. One of skill in the art could routinely perform empirical activity tests to determine the bioactivity of the compound in bioassays and thus determine what dosage is the effective amount to administer.

The compounds of the invention may be formulated with conventional excipients, such as a filler, a disintegrating agent, a binder, a lubricant, a flavoring agent, a color additive, or a carrier. The carrier may be for example a diluent, an aerosol, a topical carrier, an aqueous solution, a nonaqueous solution or a solid carrier. The carrier may be a polymer or a toothpaste. A carrier in this invention encompasses any of the standard pharmaceutically accepted carriers, such as phosphate buffered saline solution, acetate buffered saline solution, water, emulsions such as an oil/water emulsion or a triglyceride emulsion, various types of wetting agents, tablets, coated tablets and capsules.

When provided orally or topically, such compounds would be provided to a subject by delivery in different pharmaceutical carriers. Typically, such carriers contain excipients such as starch, milk, sugar, certain types of clay, gelatin, stearic acid, talc, vegetable fats or oils, gums, or glycols. The specific carrier would need to be selected based upon the desired method of delivery, for example, phosphate buffered saline (PBS) could be used for intravenous or systemic delivery and vegetable fats, creams, salves, ointments or gels may be used for topical delivery.

The compounds of the present invention may be delivered together with suitable diluents, preservatives, solubilizers, emulsifiers, adjuvants and/or carriers. Such compositions are liquids or lyophilized or otherwise dried formulations and include diluents of various buffer content (for example, Tris-HCl, acetate, phosphate), pH and ionic strength, additives such as albumins or gelatin to prevent absorption to surfaces, detergents (for example, TWEEN 20, TWEEN 80, PLURONIC F68, bile acid salts), solubilizing agents (for example, glycerol, polyethylene glycerol), anti-oxidants (for example ascorbic acid, sodium metabisulfate), preservatives (for example, thimerosal, benzyl alcohol, parabens), bulking substances or tonicity modifiers (for example, lactose, mannitol), covalent attachment of polymers such as polyethylene glycol, complexation with metal ions, or incorporation of the compound into or onto particulate preparations of hydrogels or liposomes, micro-emulsions, micelles, unilamellar or multilamellar vesicles, erythrocyte ghosts, or spheroplasts. Such compositions will influence the physical state, solubility, stability, rate of *in vivo* release, and rate of *in vivo* clearance of the compound or composition. The choice of compositions will depend on the physical and chemical properties of the compound capable of treating or inhibiting a pathological condition or disorder.

The compound of the present invention may be delivered locally via a capsule that allows a sustained release of the compound over a period of time. Controlled or sustained release compositions include formulation in lipophilic depots (for example, fatty acids, waxes, oils).

For purposes of this invention a pathological condition or disorder is linked to kinase molecules and inhibition of the signals generated by these molecules. Generated signals regulate a number of cellular functions such as cell growth, differentiation and cell death. The signals generated by these molecules have been implicated in initiation of tissue level responses, discussed in detail in the "Background of the Invention". The tissue level response triggers cellular damage or deregulated cellular growth. Deregulated cell growth occurs as a result of perturbed signals that moderate or alter cellular behaviour or function. One method of treating a pathological condition or disorder would be to intercept the generated signal before it reaches the tissue. As described in detail previously specific kinases are associated with cellular events that have been implicated in pathological conditions or disorders

including, but not limited to, cancer, stroke, osteoporosis, polycystic kidney disease, autoimmune disease, rheumatoid arthritis, neuropathic pain, and transplant rejection.

A pathological condition or disorder is mediated in a mammal when it is linked to kinase molecules as described above. For purpose of this invention a condition or disorder mediated in a mammal is one that effects or acts to alter the mammal's normal state.

For purposes of this invention cancer is a cellular tumor. The natural course of the cancer is fatal. Metastasis develops as a result of adhesion of tumor cells to the vascular endothelium. As the tumor grows, cells are shed in the circulation and spawn an independent tumor nodule known as a metastasis.

The following experimental details are set forth to aid in an understanding of the invention, and are not intended, and should not be construed, to limit in any way the invention set forth in the claims that follow thereafter.

#### DETAILED DESCRIPTION OF THE INVENTION

The compounds of this invention were prepared according to the following schemes: (1) from commercially available starting materials or: (2) from known starting materials which can be prepared as described in literature procedures or: (3) from new intermediates described in the schemes and experimental procedures. Optically active isomers may be prepared, for example, by resolving racemic derivatives or by asymmetric synthesis. The resolution can be carried out by methods known to those skilled in the art such as in the presence of a resolving agent, by chromatography, or combinations thereof.

Reactions are performed in a solvent appropriate to the reagents and materials employed and suitable for the transformation being effected. It is understood by those skilled in the art of organic synthesis that the various functionalities present on the molecule must be consistent with the chemical transformations proposed. This may necessitate judgement as to the order of synthetic steps, protecting groups, if required, and deprotection conditions. Substituents on the starting materials may be incompatible with some of the reaction

conditions. Such restrictions to the substituents which are compatible with the reaction conditions will be apparent to one skilled in the art. Reactions are run under inert atmospheres where appropriate.

5 The preparation of the compounds and intermediates of this invention encompassed by formulas **1a** and **1b** is described as follows.

As shown in Scheme 1, decarboxylation of a 3-amino-2-thiophenecarboxylate of formula 1 with N-methylpiperazine in N-methylpyrrolidinone provides 3-aminothiophenes of formula 2. This decarboxylation can also be performed in a base such as aqueous sodium hydroxide at elevated temperatures. Addition of ethyl  
10 (ethoxymethylene) cyanoacetate to compounds of formula 2, in a solvent such as toluene, provides the intermediate propenoate. Thermal cyclization of these intermediate propionates in a solvent system such as biphenyl and diphenyl ether results in 7-oxo-4,7-dihydrothieno[3,2-b]pyridine-6-carbonitriles of formula 3. Compounds of formula 3 can also be prepared by the alternate route depicted in  
15 Scheme 1. Treatment of 3-amino-2-thiophenecarboxylates of formula 1 with the dimethylacetal of dimethylformamide provides amidines of formula 4. Addition of these amidines to the anion of acetonitrile, generated at low temperature, preferably -78°C by the action of n-butyl lithium on acetonitrile, in a solvent such as tetrahydrofuran, provides 7-oxo-4,7-dihydrothieno[3,2-b]pyridine-6-carbonitriles of  
20 formula 3.

Treatment of compounds of formula 3 with a chlorinating agent, preferably phosphorous oxychloride, provides compounds of formula 5. Addition of a compound of formula  $R^1XH$ , where X is NH or  $NR^4$ , to compounds of formula 5, in the presence of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated  
25 temperatures of 110-130°C, or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of 60-70°C, provides compounds of formula **1a** of the invention where X is NH or  $NR^4$ . Alternatively addition of a compound of formula  $R^1XH$ , where X is NH or  $NR^4$ , to a compound of formula 5 in the presence of a palladium catalyst such as tris(dibenzylideneacetone)-  
30 dipalladium(0) and a ligand such as 2-dicyclohexylphosphino-2'-(N,N-dimethylamino)biphenyl, and potassium phosphate in a solvent such as ethylene

glycol dimethyl ether at elevated temperatures of preferentially 90°C provides compounds of formula Ia of the invention where X is NH or NR<sup>4</sup>. Addition of a compound of formula R<sup>1</sup>XH, where X is O, to compounds of formula 5, optionally with the addition of a base such as potassium carbonate in a solvent such as dimethylformamide at elevated temperature, provides compounds of formula Ia of the invention where X is O. Addition of a compound of formula R<sup>1</sup>XH, where X is S, to compounds of formula 5, in a solvent such as dimethylformamide, provides compounds of formula Ia of the invention where X is S. Addition of a compound of formula R<sup>1</sup>XH, where X is NHCH<sub>2</sub>, to compounds of formula 5, optionally with the addition of a base such as N,N-diisopropylamine in a solvent such as 2-ethoxyethanol at elevated temperature, provides compounds of formula Ia of the invention where X is NHCH<sub>2</sub>. Alternatively the ethyl ester group of 6, ethyl 7-chlorothieno[3,2-b]pyridine-6-carboxylate [Thompson, M.; Forbes, I. F. EP 126970] is hydrolyzed to the corresponding 6-carboxylic acid 7 with aqueous sodium hydroxide in a cosolvent such as ethanol at elevated temperature. The corresponding 6-carboxamide analog 8 is prepared by treatment of 7 with a reagent such as thionyl chloride or alternatively N,N-carbonyldiimidazole and the like, followed by the addition of aqueous ammonium hydroxide or alternatively ammonia gas. Dehydration of 8 with a reagent such as cyanuric chloride provides the key intermediate 7-chlorothieno[3,2-b]pyridine-6-carbonitrile 5, where R<sup>2</sup> is H.

Scheme 1

Compounds of formula **1a** of the invention can also be prepared according to the routes depicted in Scheme 2. Ethyl 2-bromo-7-chlorothieno[3,2-b]pyridine-6-carboxylate, **9**, [Elliott, R.; O'Hanlon, P. J.; Rodgers, N. B. *Tetrahedron*, **43**(14), 3295 (1987)] is converted to the corresponding acid **10** by treatment with aqueous sodium hydroxide in a cosolvent such as ethanol at elevated temperatures of 60-70°C. The corresponding 6-carboxamide analog **11** is prepared by treatment of **10** with a reagent such as thionyl chloride or alternatively N,N-carbonyldiimidazole and the like, followed by the addition of aqueous ammonium hydroxide or alternatively ammonia gas. Treatment of **11** with a reagent such as phosphorous oxychloride provides the key intermediate 2-bromo-7-chlorothieno[3,2-b]pyridine-6-carbonitrile **12**. Addition of a compound of formula R<sup>1</sup>XH, where X is NH or NR<sup>4</sup>, to compounds of formula **12**, in the presence of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of 110-130°C, or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of 60-70°C, provides compounds of formula **1a** of the invention where X is NH or NR<sup>4</sup>. Addition of a compound of formula R<sup>1</sup>XH, where X is O, to compounds of formula **5**, optionally with the addition of a base such as potassium carbonate in a solvent such as dimethylformamide at elevated temperature, provides compounds of formula **1a** of the invention where X is O. Addition of a compound of formula R<sup>1</sup>XH, where X is S, to compounds of formula **5**, in a solvent such as dimethylformamide, provides compounds of formula **1a** of the invention where X is S. Addition of a compound of formula R<sup>1</sup>XH, where X is NHCH<sub>2</sub>, to compounds of formula **5**, optionally with the addition of a base such as N,N-diisopropylamine in a solvent such as 2-ethoxyethanol at elevated temperature, provides compounds of formula **1a** of the invention where X is NHCH<sub>2</sub>.

Scheme 2 also depicts an alternate route for the preparation of the key intermediate **12**.

Treatment of thiophene **5** with a base, preferentially lithium diisopropylamine (LDA) but also including n-butyl lithium, t-butyl lithium or sodium hydride in an inert solvent, preferably tetrahydrofuran, but also including diethyl ether, in the optional presence of TMEDA (N, N, N', N'-tetramethylethylenediamine), at reduced temperature, preferably at about -78°C, followed by the addition of 1,2-dibromo-

1,1,2,2,-tetrafluoroethane or bromine, followed by warming to room temperature provides 12.

5 Treatment of thiophene 5 with a base, preferentially lithium diisopropylamine (LDA) but also including n-butyl lithium, t-butyl lithium or sodium hydride in an inert solvent, preferably tetrahydrofuran, but also including diethyl ether, in the optional presence of TMEDA (N, N, N', N'-tetramethylethylenediamine), at reduced temperature, preferably at about -78°C, followed by the addition of iodine, followed by warming to room temperature provides 13.

10 Addition of a compound of formula  $R^1XH$  where X is NH or  $NR^4$  to compound 13, optionally in the presence of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of 110-130°C, or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of 60-70°C, provides compounds of formula **1a** of the invention where  $R^2$  is I. Addition of a compound of formula  $R^1XH$ , where X is O, to compounds of formula 13, optionally  
15 with the addition of a base such as potassium carbonate in a solvent such as dimethylformamide at elevated temperature, provides compounds of formula **1a** of the invention where X is O. Addition of a compound of formula  $R^1XH$ , where X is S, to compounds of formula 13, in a solvent such as dimethylformamide, provides compounds of formula **1a** of the invention where X is S. Addition of a compound of  
20 formula  $R^1XH$ , where X is  $NHCH_2$ , to compounds of formula 13, optionally with the addition of a base such as N,N-diisopropylamine in a solvent such as 2-ethoxyethanol at elevated temperature, provides compounds of formula **1a** of the invention where X is  $NHCH_2$ .

Scheme 2

Scheme 3 depicts the preparation of compounds of formula **Ia** of the invention with additional  $\text{R}^2$  groups. Treatment of thiophene **5** with a base, preferentially lithium diisopropylamine (LDA), in an inert solvent such as tetrahydrofuran at reduced temperature, preferably  $-78^\circ\text{C}$ , followed by the addition of a compound of formula  $\text{R}^2\text{LG}$ , where LG is a leaving group, preferably iodo, and  $\text{R}^2$  is preferably an alkyl group, provides compounds of formula **5**, where  $\text{R}^2$  is alkyl. Addition of a compound

of formula  $R^1XH$ , where X is NH or  $NR^4$ , to compounds of formula 5, in the presence of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of 110-130°C, or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of 60-70°C, provides compounds of formula **1a** of the invention where X is NH or  $NR^4$ . Alternatively addition of a compound of formula  $R^1XH$ , where X is NH or  $NR^4$ , to a compound of formula 5 in the presence of a palladium catalyst such as tris(dibenzylideneacetone)-dipalladium(0) and a ligand such as 2-dicyclohexylphosphino-2'-(N,N-dimethylamino)biphenyl, and potassium phosphate in a solvent such as ethylene glycol dimethyl ether at elevated temperatures of preferentially 90°C provides compounds of formula **1a** of the invention where X is NH or  $NR^4$ . Addition of a compound of formula  $R^1XH$ , where X is O, to compounds of formula 5, optionally with the addition of a base such as potassium carbonate in a solvent such as dimethylformamide at elevated temperature, provides compounds of formula **1a** of the invention where X is O. Addition of a compound of formula  $R^1XH$ , where X is S, to compounds of formula 5, in a solvent such as dimethylformamide, provides compounds of formula **1a** of the invention where X is S. Addition of a compound of formula  $R^1XH$ , where X is  $NHCH_2$ , to compounds of formula 5, optionally with the addition of a base such as N,N-diisopropylamine in a solvent such as 2-ethoxyethanol at elevated temperature, provides compounds of formula **1a** of the invention where X is  $NHCH_2$ . Alternatively, treatment of thiophene 5 with a base, preferentially lithium diisopropylamine (LDA), in an inert solvent such as tetrahydrofuran at reduced temperature, preferably -78°C, followed by the addition of a formylating agent, preferably N,N-dimethylformamide (DMF) provides compounds of formula 5, where  $R^2$  is formyl. Reaction of the formyl group of 5 with a Wittig reagent, such as (tert-butoxycarbonylmethylene)-triphenylphosphorane in an inert solvent, preferably dichloromethane, provides  $\alpha,\beta$ -unsaturated esters of formula 14. Addition of a compound of formula  $R^1XH$  where X is NH or  $NR^4$ , to compounds of formula 14, preferentially under palladium catalyzed coupling conditions, including the use of tris(dibenzylideneacetone)-dipalladium(0) and (2-dicyclohexylphosphino-2'-(N,N-dimethylamino)biphenyl, in a solvent such as ethylene glycol dimethyl ether at elevated temperatures such as 90°C, provides compounds of formula **1a** of the invention where  $R^2$  is an unsaturated ester. Compounds of formula **1a** of the where  $R^2$

is an unsaturated ester can be converted into compounds of formula **1a** of the invention where  $R^2$  is an unsaturated acid, by treatment with aqueous base in the presence of an optional cosolvent such as ethanol or methanol. Compounds of formula **1a** of the invention where  $R^2$  is an  $\alpha,\beta$ -unsaturated amide can be obtained by  
5 treatment of compounds of formula **1a** of the invention where  $R^2$  is an  $\alpha,\beta$ -unsaturated acid with an agent such as N,N-carbonyldiimidazole followed by the addition of an amine of formula QH.

Scheme 3

Additional compounds of the invention of formula **Ia** where R<sup>2</sup> is an alkenyl, alkynyl, heteroaryl or aryl group can be prepared as depicted in Scheme 4 from compounds of formula **Ia** where R<sup>2</sup> is either I or Br. Treatment of compounds of formula **Ia** where R<sup>2</sup> is either I or Br with an alkenyl or alkynyl of formula R<sup>3</sup>-H in the presence of a palladium catalyst provides compounds of formula **Ia** where R<sup>2</sup> is either

an alkenyl or alkynyl group. This alkenyl or alkynyl group can be substituted by groups including aryl and heteroaryl and also alkyl and alkylamino among others.

For the addition of alkenyls of formula  $R^3-H$  the preferred palladium catalyst is palladium acetate in the presence of a ligand, preferably tri-*o*-tolylphosphine, in a solvent system that includes triethylamine or preferably a mixture of triethylamine and N,N-dimethylformamide. For the addition of alkynyls of formula  $R^3-H$  the preferred palladium catalyst is tetrakis(triphenylphosphine)palladium (0) along with a catalytic amount of copper(I)iodide in a solvent mixture that includes triethylamine and benzene.

Treatment of compounds of formula **1a** where  $R^2$  is either I or Br with an aryl or heteroaryl organoboron compound of formula  $R^3-BL^1L^2$  in the presence of a palladium catalyst provides compounds of formula **1a** where  $R^2$  is either an aryl or heteroaryl group. In compounds of formula  $R^3-BL^1L^2$ , the  $L^1L^2$  groups represent ligands and include such groups as lower alkoxy or preferably hydroxy. The aryl or heteroaryl group of compound  $R^3-BL^1L^2$  can be substituted by groups including aryl and heteroaryl and also formyl, carboxylate, alkyl and alkylamino among others. The aryl or heteroaryl group of compound  $R^3-BL^1L^2$  can also be fused to a second aryl or heteroaryl group. For the addition of compounds of formula  $R^3-BL^1L^2$  the preferred palladium catalyst is tetrakis(triphenylphosphine)palladium (0) in a solvent mixture that includes saturated aqueous sodium bicarbonate and ethylene glycol dimethyl ether.

Compounds of formula **1a** where  $R^2$  is either aryl or heteroaryl can also be prepared by reaction of a compound of formula **1a** where  $R^2$  is either I or Br with an aryl or heteroaryl stannane compound of formula  $R^3-SnR_3$  in the presence of a palladium catalyst. In compounds of formula  $R^3-SnR_3$  the R group is a lower alkyl group such as butyl or methyl. The aryl or heteroaryl group of compound  $R^3-SnR_3$  can be substituted by groups including aryl and heteroaryl and also formyl, carboxylate, acetal, alkyl and alkylamino among others. The aryl or heteroaryl group of compound  $R^3-SnR_3$  can also be fused to a second aryl or heteroaryl group. For the addition of compounds of formula  $R^3-SnR_3$  the preferred palladium catalyst is bis(triphenylphosphine)palladium (II) chloride in a solvent such as dioxane.

Compounds of formula **1a** where  $R^2$  is an alkynyl group can be prepared by the alternative route shown in Scheme 4. Treatment of a compound of formula **1a**, where  $R^2$  is either Br or I with (trimethylsilyl)acetylene in the presence of a palladium catalyst, preferably tetrakis(triphenylphosphine)palladium(0), with a catalytic amount of copper(I) iodine in a solvent system such as triethylamine and benzene, provides compounds of formula **1a** where  $R^2$  is a 2-(trimethylsilyl)ethynyl group. Reaction of compounds of formula **1a** where  $R^2$  is a 2-(trimethylsilyl)ethynyl group with aryl iodides or heteroaryl iodides in the presence of a palladium catalyst, preferably bis(triphenylphosphine)palladium(II)chloride, in the presence of triphenylphosphine, potassium carbonate and copper(I) iodide, in a solvent mixture of tetrahydrofuran and methanol, provides compounds of formula **1a** where  $R^2$  is a 2-(aryl)ethynyl or a 2-(heteroaryl)ethynyl group. In addition the 2-(trimethylsilyl)ethynyl group can be cleaved by treatment with potassium carbonate in methanol to provide compounds of formula **1a** where  $R^2$  is an ethynyl group.

Scheme 4

Some additional routes to the compounds of the invention of formula **Ia** are shown in Scheme 5. Compounds of formula **Ia** where the group  $\text{R}^2$  is  $\text{R}^3\text{-CHO}$  can be

converted to compounds of formula **1a** where the group  $R^2$  is  $R^3\text{-CH}_2\text{Q}$  via reductive amination. Treatment of compounds of formula **1a** where the group  $R^2$  is  $R^3\text{-CHO}$  with an amine of formula QH in the presence of a reducing agent, preferably sodium triacetoxyborohydride, in a solvent system that includes dichloromethane and N,N-dimethylformamide or NMP optionally in the presence of acetic acid, provides compounds of formula **1a** where the group  $R^2$  is  $R^3\text{-CH}_2\text{Q}$ . Compounds of formula **1a** where the group  $R^2$  is  $R^3\text{-CH}_2\text{OH}$  may be obtained as a by-product of this reaction, via reduction of the formyl group of compounds of formula **1a** where the group  $R^2$  is  $R^3\text{-CHO}$ .

10           Compounds of formula **1a** where the group  $R^2$  is  $R^3\text{-CHO}$  can be prepared by hydrolysis of the acetal group of compounds of formula **1a** where the group  $R^2$  is  $R^3\text{-acetal}$ , preferably with aqueous hydrochloric acid in the presence of a cosolvent such as tetrahydrofuran.

15           Scheme 5 also depicts the preparation of compounds of formula **1a** where the group  $R^2$  is  $R^3(\text{C}(\text{R}^8)_2)_q\text{-CO}_2\text{H}$ , and  $R^3(\text{C}(\text{R}^8)_2)_q\text{-COQ}$  from compounds of formula **1a** where the group  $R^2$  is  $R^3(\text{C}(\text{R}^8)_2)_q\text{-CO}_2\text{R}^4$ . Compounds of formula **1a** where the group  $R^2$  is  $R^3(\text{C}(\text{R}^8)_2)_q\text{-CO}_2\text{R}^4$  are converted to the corresponding acids of formula **1a** where the group  $R^2$  is  $R^3(\text{C}(\text{R}^8)_2)_q\text{-CO}_2\text{H}$  by treatment with aqueous sodium hydroxide in a cosolvent such as ethanol at elevated temperatures. The corresponding amides of  
20           formula **1a** where the group  $R^2$  is  $R^3(\text{C}(\text{R}^8)_2)_q\text{-Q}$  are prepared by treatment of the acid with N,N-carbonyldiimidazole or alternatively thionyl chloride or the like, followed by the addition of an amine of formula QH.

Scheme 6 depicts preparation of compounds of the invention of formula **Ib**. Addition of a compound of formula  $\text{R}^1\text{XH}$ , where  $\text{X}$  is  $\text{NH}$  or  $\text{NR}^4$ , to compounds of formula **15**, [Khan, M. A.; Guarconi, A. E., *J. Heterocyclic Chem.*, 14, 807 (1977)] in

the presence of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of 110-130°C, or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of 60-70°C, provides compounds of formula **1b** of the invention where X is NH or NR<sup>4</sup>. Alternatively

5 addition of a compound of formula R<sup>1</sup>XH, where X is NH or NR<sup>4</sup>, to a compound of formula 15 in the presence of a palladium catalyst such as tris(dibenzylideneacetone)-dipalladium(0) and a ligand such as 2-dicyclohexylphosphino-2'-(N,N-dimethylamino)biphenyl, and potassium phosphate in a solvent such as ethylene glycol dimethyl ether at elevated temperatures of

10 preferentially 90°C provides compounds of formula **1b** of the invention where X is NH or NR<sup>4</sup>. Addition of a compound of formula R<sup>1</sup>XH, where X is O, to compounds of formula 15, optionally with the addition of a base such as potassium carbonate in a solvent such as dimethylformamide at elevated temperature, provides compounds of formula **1b** of the invention where X is O. Addition of a compound of formula R<sup>1</sup>XH,

15 where X is S, to compounds of formula 15, in a solvent such as dimethylformamide, provides compounds of formula **1b** of the invention where X is S. Addition of a compound of formula R<sup>1</sup>XH, where X is NHCH<sub>2</sub>, to compounds of formula 15, optionally with the addition of a base such as N,N-diisopropylamine in a solvent such as 2-ethoxyethanol at elevated temperature, provides compounds of formula **1b** of the

20 invention where X is NHCH<sub>2</sub>.

Scheme 6 also depicts a route for the preparation of key intermediates of formula 16. Treatment of thiophene 15 with a base, preferentially lithium diisopropylamine (LDA) but also including n-butyl lithium, t-butyl lithium or sodium hydride in an inert solvent, preferably tetrahydrofuran, but also including diethyl

25 ether, in the optional presence of TMEDA (N, N, N', N'-tetramethylethylenediamine), at reduced temperature, preferably at about -78°C, followed by the addition of 1,2-dibromo-1,1,2,2-tetrafluoroethane or bromine, followed by warming to room temperature provides 16.

Treatment of thiophene 15 with a base, preferentially lithium diisopropylamine

30 (LDA) but also including n-butyl lithium, t-butyl lithium or sodium hydride in an inert solvent, preferably tetrahydrofuran, but also including diethyl ether, in the optional presence of TMEDA (N, N, N', N'-tetramethylethylenediamine), at reduced

temperature, preferably at about  $-78^{\circ}\text{C}$ , followed by the addition of iodine, followed by warming to room temperature provides 16.

Addition of a compound of formula  $\text{R}^1\text{XH}$  where X is NH or  $\text{NR}^4$ , to compounds of formula 16, in the presence of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of  $110\text{--}130^{\circ}\text{C}$ , or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of  $60\text{--}70^{\circ}\text{C}$ , provides compounds of formula **1b** of the invention where where X is NH or  $\text{NR}^4$ . Addition of a compound of formula  $\text{R}^1\text{XH}$ , where X is O, to compounds of formula 16, optionally with the addition of a base such as potassium carbonate in a solvent such as dimethylformamide at elevated temperature, provides compounds of formula **1b** of the invention where X is O. Addition of a compound of formula  $\text{R}^1\text{XH}$ , where X is S, to compounds of formula 16, in a solvent such as dimethylformamide, provides compounds of formula **1b** of the invention where X is S. Addition of a compound of formula  $\text{R}^1\text{XH}$ , where X is  $\text{NHCH}_2$ , to compounds of formula 16, optionally with the addition of a base such as N,N-diisopropylamine in a solvent such as 2-ethoxyethanol at elevated temperature, provides compounds of formula **1b** of the invention where X is  $\text{NHCH}_2$ .

Scheme 6 also depicts an alternate route for the preparation of key intermediate 15, starting from compound 17 [Khan, M. A.; Guarconi, A. E., *J. Heterocyclic Chem.*, 14, 807 (1977)]. The ethyl ester group of ethyl 4-chlorothieno[2,3-b]pyridine-5-carboxylate, 17, is hydrolyzed to the corresponding 5-carboxylic acid 18 with aqueous sodium hydroxide in a cosolvent such as ethanol at elevated temperature. The corresponding 5-carboxamide analog 19 is prepared by treatment of 18 with a reagent such as thionyl chloride or alternatively N,N-carbonyldiimidazole and the like, followed by the addition of aqueous ammonium hydroxide or alternatively ammonia gas. Dehydration of 19 with a reagent such as cyanuric chloride provides the key intermediate 4-chlorothieno[3,2-b]pyridine-5-carbonitrile 15.

Scheme 6 also depicts the preparation of compounds of the invention of formula **1b** where  $\text{R}^2$  is alkyl. Treatment of 15 with a base, preferentially lithium diisopropylamine (LDA), in an inert solvent such as tetrahydrofuran at reduced

temperature, preferably  $-78^{\circ}\text{C}$ , followed by the addition of a  $\text{R}^2\text{LG}$ , where LG is a leaving group, preferably iodo, provides the key intermediate 20 where  $\text{R}^2$  is alkyl. Addition of a compound of formula  $\text{R}^1\text{XH}$  where X is NH or  $\text{NR}^4$  to compounds of formula 20, in the presence of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of  $110\text{--}130^{\circ}\text{C}$ , or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of  $60\text{--}70^{\circ}\text{C}$ , provides compounds of formula **1b** of the invention where X is NH or  $\text{NR}^4$ . Alternatively addition of a compound of formula  $\text{R}^1\text{XH}$  where X is NH or  $\text{NR}^4$  to a compound of formula 20 in the presence of a palladium catalyst such as tris(dibenzylideneacetone)-dipalladium(0) and a ligand such as 2-dicyclohexylphosphino-2'-(N,N-dimethylamino)biphenyl, and potassium phosphate in a solvent such as ethylene glycol dimethyl ether at elevated temperatures of preferentially  $90^{\circ}\text{C}$  provides compounds of formula **1b** of the invention where X is NH or  $\text{NR}^4$ . Addition of a compound of formula  $\text{R}^1\text{XH}$ , where X is O, to compounds of formula 20, optionally with the addition of a base such as potassium carbonate in a solvent such as dimethylformamide at elevated temperature, provides compounds of formula **1b** of the invention where X is O. Addition of a compound of formula  $\text{R}^1\text{XH}$ , where X is S, to compounds of formula 20, in a solvent such as dimethylformamide, provides compounds of formula **1b** of the invention where X is S. Addition of a compound of formula  $\text{R}^1\text{XH}$ , where X is  $\text{NHCH}_2$ , to compounds of formula 20, optionally with the addition of a base such as N,N-diisopropylamine in a solvent such as 2-ethoxyethanol at elevated temperature, provides compounds of formula **1b** of the invention where X is  $\text{NHCH}_2$ .

Scheme 6

Scheme 7 depicts an alternate route for the preparation of compounds of the invention of formula **Ib**. A suitably substituted thiophene of formula **21** is nitrated, preferably with nitric acid in acetic anhydride at reduced temperature to provide 2-nitrothiophenes of formula **22**. Reduction of the nitro group of compounds of formula **22** with a reducing agent, preferably hydrogen gas in the presence of a catalyst, preferably palladium hydroxide in a solvent, which includes methanol, provides

compounds of formula 23. Addition of ethyl (ethoxymethylene)cyanoacetate in a solvent such as toluene followed by cyclization at high temperatures, preferably in a solvent system of biphenyl and diphenyl ether at reflux, and subsequent chlorination with phosphorous oxychloride, preferably with a catalytic amount of N,N-dimethylformamide, results in compounds of formula 24. Addition of a compound of formula  $R^1XH$  where X is NH or  $NR^4$  to compounds of formula 24, optionally in the presence of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of 110-130°C, or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of 60-70°C, provides compounds of formula **1b** of the invention where X is NH or  $NR^4$ . Alternatively addition of a compound of formula  $R^1XH$  where X is NH or  $NR^4$  to a compound of formula 24 in the presence of a palladium catalyst such as tris(dibenzylideneacetone)-dipalladium(0) and a ligand such as 2-dicyclohexylphosphino-2'-(N,N-dimethylamino)biphenyl, and potassium phosphate in a solvent such as ethylene glycol dimethyl ether at elevated temperatures of preferentially 90°C provides compounds of formula **1b** of the invention where X is NH or  $NR^4$ . Addition of a compound of formula  $R^1XH$  where X is NH or  $NR^4$ , where X is O, to compounds of formula 24, optionally with the addition of a base such as potassium carbonate in a solvent such as dimethylformamide at elevated temperature, provides compounds of formula **1b** of the invention where X is O. Addition of a compound of formula  $R^1XH$ , where X is S, to compounds of formula 24, in a solvent such as dimethylformamide, provides compounds of formula **1b** of the invention where X is S. Addition of a compound of formula  $R^1XH$ , where X is  $NHCH_2$ , to compounds of formula 24, optionally with the addition of a base such as N,N-diisopropylamine in a solvent such as 2-ethoxyethanol at elevated temperature, provides compounds of formula **1b** of the invention where X is  $NHCH_2$ .

Scheme 7

Additional compounds of the invention of formula **1b** where R<sup>2</sup> is an alkenyl, alkynyl, heteroaryl or aryl group from compounds of formula **1b** where R<sup>2</sup> is either I or Br can be prepared as depicted in Scheme 8. Treatment of compounds of formula **1b** where R<sup>2</sup> is either I or Br with an alkenyl or alkynyl of formula R<sup>3</sup>-H in the presence of a palladium catalyst provides compounds of formula **1b** where R<sup>2</sup> is either an alkenyl or alkynyl group. This alkenyl or alkynyl group can be substituted by groups including aryl and heteroaryl and also alkyl and alkyl amino among others. This aryl or heteroaryl group can also be substituted by groups such as alkoxy, alkylamino and others. For the addition of alkenyls of formula R<sup>3</sup>-H the preferred palladium catalyst is palladium acetate in the presence of a ligand, preferably tri-*o*-tolylphosphine, in a solvent system that includes triethylamine or preferably a mixture of triethylamine and N,N'-dimethylformamide. For the addition of alkynyls of formula R<sup>3</sup>-H the preferred palladium catalyst is tetrakis(triphenylphosphine)palladium (0) along with a catalytic amount of copper(I)iodide in a solvent mixture that includes triethylamine and benzene.

Treatment of compounds of formula **1b** where R<sup>2</sup> is either I or Br with an aryl or heteroaryl organoboron compound of formula R<sup>3</sup>-BL<sup>1</sup>L<sup>2</sup> in the presence of a palladium catalyst provides compounds of formula **1b** where R<sup>2</sup> is either an aryl or heteroaryl group. In compounds of formula R<sup>3</sup>-BL<sup>1</sup>L<sup>2</sup>, the L<sup>1</sup>L<sup>2</sup> groups represent ligands and include such groups as lower alkoxy or preferably hydroxy. The aryl or

heteroaryl group of compound  $R^3\text{-BL}^1\text{L}^2$  can be substituted by groups including aryl and heteroaryl and also formyl, carboxylate, alkyl and alkylamino among others. The aryl or heteroaryl group of compound  $R^3\text{-BL}^1\text{L}^2$  can also be fused to a second aryl or heteroaryl group. For the addition of compounds of formula  $R^3\text{-BL}^1\text{L}^2$  the preferred

5 palladium catalyst is tetrakis(triphenylphosphine)palladium (0) in a solvent mixture that includes saturated aqueous sodium bicarbonate and ethylene glycol dimethyl ether.

Compounds of formula **1b** where  $R^2$  is either aryl or heteroaryl can also be prepared by reaction of a compound of formula **1b** where  $R^2$  is either I or Br with an

10 aryl or heteroaryl stannane compound of formula  $R^3\text{-SnR}_3$  in the presence of a palladium catalyst. In compounds of formula  $R^3\text{-SnR}_3$  the R group is a lower alkyl group such as butyl or methyl. The aryl or heteroaryl group of compound  $R^3\text{-SnR}_3$  can be substituted by groups including aryl and heteroaryl and also formyl, carboxylate, acetal, alkyl and alkylamino among others. The aryl or heteroaryl group

15 of compound  $R^3\text{-SnR}_3$  can also be fused to a second aryl or heteroaryl group. For the addition of compounds of formula  $R^3\text{-SnR}_3$  the preferred palladium catalyst is bis(triphenylphosphine)palladium (II) chloride in a solvent such as dioxane.

Compounds of formula **1b** where  $R^2$  is an alkynyl group can be prepared by the alternative route shown in Scheme 8. Treatment of a compound of formula **1b**,

20 where  $R^2$  is either Br or I with (trimethylsilyl)acetylene in the presence of a palladium catalyst, preferably tetrakis(triphenylphosphine)palladium(0), with a catalytic amount of copper(I) iodine in a solvent system such as triethylamine and benzene, provides compounds of formula **1b** where  $R^2$  is a 2-(trimethylsilyl)ethynyl group. Reaction of compounds of formula **1b** where  $R^2$  is a 2-(trimethylsilyl)ethynyl group with aryl iodides

25 or heteroaryl iodides in the presence of a palladium catalyst, preferably bis(triphenylphosphine)palladium(II)chloride, in the presence of triphenylphosphine, potassium carbonate and copper(I) iodide, in a solvent mixture of tetrahydrofuran and methanol, provides compounds of formula **1b** where  $R^2$  is a 2-(aryl)ethynyl or a 2-(heteroaryl)ethynyl group. In addition the 2-(trimethylsilyl)ethynyl group can be

30 cleaved by treatment with potassium carbonate in methanol to provide compounds of formula **1b** where  $R^2$  is an ethynyl group.

Scheme 8

Some additional routes to the compounds of the invention of formula **Ib** are shown in Scheme 9. Compounds of formula **Ib** where the group  $\text{R}^2$  is  $\text{R}^3\text{-CHO}$  can be

converted to compounds of formula **1b** where the group  $R^2$  is  $R^3\text{-CH}_2\text{Q}$  via reductive amination. Treatment of compounds of formula **1b** where the group  $R^2$  is  $R^3\text{-CHO}$  with an amine of formula QH in the presence of a reducing agent, preferably sodium triacetoxyborohydride, in a solvent system that includes dichloromethane and N,N-dimethylformamide or NMP, provides compounds of formula **1b** where the group  $R^2$  is  $R^3\text{-CH}_2\text{Q}$ . Compounds of formula **1b** where the group  $R^2$  is  $R^3\text{-CH}_2\text{OH}$  may be obtained as a by-product of this reaction, via reduction of the formyl group of compounds of formula **1b** where the group  $R^2$  is  $R^3\text{-CHO}$ .

Compounds of formula **1b** where the group  $R^2$  is  $R^3\text{-CHO}$  can be prepared by hydrolysis of the acetal group of compounds of formula **1b** where the group  $R^2$  is  $R^3\text{-acetal}$ , preferably with aqueous hydrochloric acid in the presence of a cosolvent such as tetrahydrofuran.

Scheme 9 also depicts the preparation of compounds of formula **1b** where the group  $R^2$  is  $R^3$  substituted with  $(\text{C}(\text{R}^8)_2)_q\text{-CO}_2\text{H}$ , and  $(\text{C}(\text{R}^8)_2)_q\text{-COQ}$  from compounds of formula **1b** where the group  $R^2$  is  $R^3$  substituted by  $(\text{C}(\text{R}^8)_2)_q\text{-CO}_2\text{R}^4$ . Compounds of formula **1b** where the group  $R^2$  is  $R^3$  substituted with  $(\text{C}(\text{R}^8)_2)_q\text{-CO}_2\text{R}^4$  are converted to the corresponding acids of formula **1b** where the group  $R^2$  is  $R^3$  substituted by  $(\text{C}(\text{R}^8)_2)_q\text{-CO}_2\text{H}$  by treatment with aqueous sodium hydroxide in a cosolvent such as ethanol at elevated temperatures. The corresponding amides of formula **1b** where the group  $R^2$  is  $R^3$  substituted with  $(\text{C}(\text{R}^8)_2)_q\text{-COQ}$  are prepared by treatment of the acids with N,N-carbonyldiimidazole or alternatively thionyl chloride or the like, followed by the addition of an amine of formula QH.

Scheme 9

Scheme 10 depicts the preparation of key sulfoxide intermediate 25. Oxidation of 12 or 13 with an oxidizing agent such as m-chloroperbenzoic acid, peracetic acid or an oxaziridine provides the sulfoxide derivative 25. The reaction conditions must be controlled to prevent overoxidation to the sulfone. If both the sulfoxide and sulfone are obtained in the reaction, they can be separated by standard laboratory techniques. Addition of a compound of formula  $R^1XH$  where X is NH or  $NR^4$  to compounds of formula 25, in the presence of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of 110-130°C, or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of 60-70°C, provides compounds of formula **1c** of the invention where X is NH or  $NR^4$ . Addition of a compound of formula  $R^1XH$ , where X is O, to compounds of formula 25, optionally with the addition of a base such as potassium carbonate in a solvent such as dimethylformamide at elevated temperature, provides compounds of formula **1c** of the invention where X is O. Addition of a compound of formula  $R^1XH$ , where X is S, to compounds of formula 25, in a solvent such as dimethylformamide, provides compounds of formula **1c** of the invention where X is S. Addition of a compound of formula  $R^1XH$ , where X is  $NHCH_2$ , to compounds of formula 25, optionally with the addition of a base such as N,N-diisopropylamine in a solvent such as 2-ethoxyethanol at elevated temperature, provides compounds of formula **1c** of the invention where X is  $NHCH_2$ .

Compounds of the invention of formula **1c** where  $R^2$  is an alkene, alkyne, heteroaryl or aryl group can be prepared as depicted in Scheme 10 from compounds of formula **1c** where  $R^2$  is either I or Br. Treatment of compounds of formula **1c** where  $R^2$  is either I or Br with an alkene or alkyne of formula  $R^3-H$  in the presence of a palladium catalyst provides compounds of formula **1c** where  $R^2$  is either an alkene or alkyne group. This alkene or alkyne group can be substituted by groups including aryl and heteroaryl and also alkyl and alkylamino among others.

For the addition of alkenes of formula  $R^3-H$  the preferred palladium catalyst is palladium acetate in the presence of a ligand, preferably tri-*o*-tolylphosphine, in a solvent system that includes triethylamine or preferably a mixture of triethylamine and N,N-dimethylformamide. For the addition of alkynes of formula  $R^3-H$  the preferred palladium catalyst is tetrakis(triphenylphosphine)palladium (0) along with a catalytic

amount of copper(I)iodide in a solvent mixture that includes triethylamine and benzene.

Treatment of compounds of formula **1c** where  $R^2$  is either I or Br with an aryl or heteroaryl organoboron compound of formula  $R^3-BL^1L^2$  in the presence of a palladium catalyst provides compounds of formula **1c** where  $R^2$  is either an aryl or heteroaryl group. In compounds of formula  $R^3-BL^1L^2$ , the  $L^1L^2$  groups represent ligands and include such groups as lower alkoxy or preferably hydroxy. The aryl or heteroaryl group of compound  $R^3-BL^1L^2$  can be substituted by groups including aryl and heteroaryl and also formyl, carboxylate, alkyl and alkylamino among others. The aryl or heteroaryl group of compound  $R^3-BL^1L^2$  can also be fused to a second aryl or heteroaryl group. For the addition of compounds of formula  $R^3-BL^1L^2$  the preferred palladium catalyst is tetrakis(triphenylphosphine)palladium (0) in a solvent mixture that includes saturated aqueous sodium bicarbonate and ethylene glycol dimethyl ether.

Compounds of formula **1c** where  $R^2$  is either aryl or heteroaryl can also be prepared by reaction of a compound of formula **1c** where  $R^2$  is either I or Br with an aryl or heteroaryl stannane compound of formula  $R^3-SnR_3$  in the presence of a palladium catalyst. In compounds of formula  $R^3-SnR_3$  the R group is a lower alkyl group such as butyl or methyl. The aryl or heteroaryl group of compound  $R^3-SnR_3$  can be substituted by groups including aryl and heteroaryl and also formyl, carboxylate, acetal, alkyl and alkylamino among others. The aryl or heteroaryl group of compound  $R^3-SnR_3$  can also be fused to a second aryl or heteroaryl group. For the addition of compounds of formula  $R^3-SnR_3$  the preferred palladium catalyst is bis(triphenylphosphine)palladium (II) chloride in a solvent such as dioxane.

Compounds of formula **1c** where  $R^2$  is an alkyne group can also be prepared by the route shown in Scheme 10. Treatment of a compound of formula **1c**, where  $R^2$  is either Br or I with (trimethylsilyl)acetylene in the presence of a palladium catalyst, preferably tetrakis(triphenylphosphine)palladium(0), with a catalytic amount of copper(I) iodine in a solvent system such as triethylamine and benzene, provides compounds of formula **1c** where  $R^2$  is a 2-(trimethylsilyl)ethynyl group. Reaction of compounds of formula **1c** where  $R^2$  is a 2-(trimethylsilyl)ethynyl group with aryl iodides

- or heteroaryl iodides in the presence of a palladium catalyst, preferably bis(triphenylphosphine)palladium(II)chloride, in the presence of triphenylphosphine, potassium carbonate and copper(I) iodide, in a solvent mixture of tetrahydrofuran and methanol, provides compounds of formula **1c** where  $R^2$  is a 2-(aryl)ethynyl or a 2-
- 5 (heteroaryl)ethynyl group. In addition the 2-(trimethylsilyl)ethynyl group can be cleaved by treatment with potassium carbonate in methanol to provide compounds of formula **1c** where  $R^2$  is an ethynyl group.

Scheme 10

Scheme 11 depicts the preparation of key sulfone intermediate 26. Oxidation of 12 or 13 with an excess of an oxidizing agent such as m-chloroperbenzoic acid, peracetic acid or an oxiziridine provides the sulfone derivative 26. If both the sulfoxide and sulfone are obtained in the reaction, they can be separated by standard laboratory techniques. Addition of a compound of formula  $R^1XH$  where X is NH or  $NR^4$ , to compound 26, in the presence of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of 110-130°C, or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of 60-70°C, provides compounds of formula **Id** of the invention where X is NH or  $NR^4$ . Addition of a compound of formula  $R^1XH$ , where X is O, to compounds of formula 26, optionally with the addition of a base such as potassium carbonate in a solvent such as dimethylformamide at elevated temperature, provides compounds of formula **Id** of the invention where X is O. Addition of a compound of formula  $R^1XH$ , where X is S, to compounds of formula 26, in a solvent such as dimethylformamide, provides compounds of formula **Id** of the invention where X is S. Addition of a compound of formula  $R^1XH$ , where X is  $NHCH_2$ , to compounds of formula 26, optionally with the addition of a base such as N,N-diisopropylamine in a solvent such as 2-ethoxyethanol at elevated temperature, provides compounds of formula **Id** of the invention where X is  $NHCH_2$ .

Compounds of the invention of formula **Id** where  $R^2$  is an alkene, alkyne, heteroaryl or aryl group can be prepared as depicted in Scheme 11 from compounds of formula **Id** where  $R^2$  is either I or Br. Treatment of compounds of formula **Id** where  $R^2$  is either I or Br with an alkene or alkyne of formula  $R^3-H$  in the presence of a palladium catalyst provides compounds of formula **Id** where  $R^2$  is either an alkene or alkyne group. This alkene or alkyne group can be substituted by groups including aryl and heteroaryl and also alkyl and alkylamino among others.

For the addition of alkenes of formula  $R^3-H$  the preferred palladium catalyst is palladium acetate in the presence of a ligand, preferably tri-*o*-tolylphosphine, in a solvent system that includes triethylamine or preferably a mixture of triethylamine and N,N-dimethylformamide. For the addition of alkynes of formula  $R^3-H$  the preferred palladium catalyst is tetrakis(triphenylphosphine)palladium (0) along with a catalytic

amount of copper(I)iodide in a solvent mixture that includes triethylamine and benzene.

Treatment of compounds of formula **Id** where  $R^2$  is either I or Br with an aryl or heteroaryl organoboron compound of formula  $R^3-BL^1L^2$  in the presence of a palladium catalyst provides compounds of formula **Id** where  $R^2$  is either an aryl or heteroaryl group. In compounds of formula  $R^3-BL^1L^2$ , the  $L^1L^2$  groups represent ligands and include such groups as lower alkoxy or preferably hydroxy. The aryl or heteroaryl group of compound  $R^3-BL^1L^2$  can be substituted by groups including aryl and heteroaryl and also formyl, carboxylate, alkyl and alkylamino among others. The aryl or heteroaryl group of compound  $R^3-BL^1L^2$  can also be fused to a second aryl or heteroaryl group. For the addition of compounds of formula  $R^3-BL^1L^2$  the preferred palladium catalyst is tetrakis(triphenylphosphine)palladium (0) in a solvent mixture that includes saturated aqueous sodium bicarbonate and ethylene glycol dimethyl ether.

Compounds of formula **Id** where  $R^2$  is either aryl or heteroaryl can also be prepared by reaction of a compound of formula **Id** where  $R^2$  is either I or Br with an aryl or heteroaryl stannane compound of formula  $R^3-SnR_3$  in the presence of a palladium catalyst. In compounds of formula  $R^3-SnR_3$  the R group is a lower alkyl group such as butyl or methyl. The aryl or heteroaryl group of compound  $R^3-SnR_3$  can be substituted by groups including aryl and heteroaryl and also formyl, carboxylate, acetal, alkyl and alkylamino among others. The aryl or heteroaryl group of compound  $R^3-SnR_3$  can also be fused to a second aryl or heteroaryl group. For the addition of compounds of formula  $R^3-SnR_3$  the preferred palladium catalyst is bis(triphenylphosphine)palladium (II) chloride in a solvent such as dioxane.

Compounds of formula **Id** where  $R^2$  is an alkyne group can also be prepared by the route shown in Scheme 11. Treatment of a compound of formula **Id**, where  $R^2$  is either Br or I with (trimethylsilyl)acetylene in the presence of a palladium catalyst, preferably tetrakis(triphenylphosphine)palladium(0), with a catalytic amount of copper(I) iodine in a solvent system such as triethylamine and benzene, provides compounds of formula **Id** where  $R^2$  is a 2-(trimethylsilyl)ethynyl group. Reaction of compounds of formula **Id** where  $R^2$  is a 2-(trimethylsilyl)ethynyl group with aryl iodides

or heteroaryliodines in the presence of a palladium catalyst, preferably bis(triphenylphosphine)palladium(II)chloride, in the presence of triphenylphosphine, potassium carbonate and copper(I) iodide, in a solvent mixture of tetrahydrofuran and methanol, provides compounds of formula **1d** where  $R^2$  is a 2-(aryl)ethynyl or a 2-

5 (heteroaryl)ethynyl group. In addition the 2-(trimethylsilyl)ethynyl group can be cleaved by treatment with potassium carbonate in methanol to provide compounds of formula **1d** where  $R^2$  is an ethynyl group.

Scheme 11

Alternate routes for the preparation of the key intermediate 25 and 26 are shown in Scheme 12. Oxidation of 5 with an oxidizing agent provides the sulfoxide 27 or the sulfone 28. Excess amounts of oxidizing agent would be expected to provide the sulfone via an intermediate sulfoxide. Treatment of sulfoxide 27 with a base, preferentially lithium diisopropylamine (LDA), in an inert solvent such as tetrahydrofuran at reduced temperature, preferably  $-78^{\circ}\text{C}$ , followed by the addition of 1,2-dibromo-1,1,2,2-tetrafluoroethane or bromine provides 25 where LG = Br. Analogously, treatment of 27 with a base, preferentially lithium diisopropylamine (LDA), in an inert solvent such as tetrahydrofuran at reduced temperature, preferably  $-78^{\circ}\text{C}$ , followed by the addition of iodine provides 25 where LG = I. In a similar fashion, treatment of sulfone 28 with a base, preferentially lithium diisopropylamine (LDA), in an inert solvent such as tetrahydrofuran at reduced temperature, preferably  $-78^{\circ}\text{C}$ , followed by the addition of 1,2-dibromo-1,1,2,2-tetrafluoroethane or bromine provides 26 where LG = Br. Analogously, treatment of 28 with a base, preferentially lithium diisopropylamine (LDA), in an inert solvent such as tetrahydrofuran at reduced temperature, preferably  $-78^{\circ}\text{C}$ , followed by the addition of iodine provides 26 where LG = I.

Scheme 12

Scheme 13 depicts the preparation of key sulfoxide intermediate 29. Oxidation of 16 with an oxidizing agent such as m-chloroperbenzoic acid, peracetic acid or an oxiziridine provides the sulfoxide derivative 29. The reaction conditions are controlled to prevent over oxidation to the sulfone. If both the sulfoxide and sulfone are obtained

5 in the reaction, they can be separated by standard laboratory techniques. Addition of a compound of formula  $R^1XH$  where X is NH or  $NR^4$ , to compound 29, in the presence of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of 110-130°C, or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of 60-70°C, provides compounds of

10 formula 1e of the invention where X is NH or  $NR^4$ . Addition of a compound of formula  $R^1XH$ , where X is O, to compounds of formula 29, optionally with the addition of a base such as potassium carbonate in a solvent such as dimethylformamide at elevated temperature, provides compounds of formula 1e of the invention where X is O. Addition of a compound of formula  $R^1XH$ , where X is S, to compounds of formula

15 29, in a solvent such as dimethylformamide, provides compounds of formula 1e of the invention where X is S. Addition of a compound of formula  $R^1XH$ , where X is  $NHCH_2$ , to compounds of formula 29, optionally with the addition of a base such as N,N-diisopropylamine in a solvent such as 2-ethoxyethanol at elevated temperature, provides compounds of formula 1e of the invention where X is  $NHCH_2$ .

20 Compounds of the invention of formula 1e where  $R^2$  is an alkene, alkyne, heteroaryl or aryl group can be prepared as depicted in Scheme 13 from compounds of formula 1e where  $R^2$  is either I or Br. Treatment of compounds of formula 1e where  $R^2$  is either I or Br with an alkene or alkyne of formula  $R^3-H$  in the presence of a palladium catalyst provides compounds of formula 1e where  $R^2$  is either an alkene or

25 alkyne group. This alkene or alkyne group can be substituted by groups including aryl and heteroaryl and also alkyl and alkylamino among others.

For the addition of alkenes of formula  $R^3-H$  the preferred palladium catalyst is palladium acetate in the presence of a ligand, preferably tri-*o*-tolylphosphine, in a solvent system that includes triethylamine or preferably a mixture of triethylamine and

30 N,N-dimethylformamide. For the addition of alkynes of formula  $R^3-H$  the preferred palladium catalyst is tetrakis(triphenylphosphine)palladium (0) along with a catalytic

amount of copper(I)iodide in a solvent mixture that includes triethylamine and benzene.

Treatment of compounds of formula **1e** where  $R^2$  is either I or Br with an aryl or heteroaryl organoboron compound of formula  $R^3-BL^1L^2$  in the presence of a  
 5 palladium catalyst provides compounds of formula **1e** where  $R^2$  is either an aryl or heteroaryl group. In compounds of formula  $R^3-BL^1L^2$ , the  $L^1L^2$  groups represent ligands and include such groups as lower alkoxy or preferably hydroxy. The aryl or heteroaryl group of compound  $R^3-BL^1L^2$  can be substituted by groups including aryl and heteroaryl and also formyl, carboxylate, alkyl and alkylamino among others. The  
 10 aryl or heteroaryl group of compound  $R^3-BL^1L^2$  can also be fused to a second aryl or heteroaryl group. For the addition of compounds of formula  $R^3-BL^1L^2$  the preferred palladium catalyst is tetrakis(triphenylphosphine)palladium (0) in a solvent mixture that includes saturated aqueous sodium bicarbonate and ethylene glycol dimethyl ether.

15 Compounds of formula **1e** where  $R^2$  is either aryl or heteroaryl can also be prepared by reaction of a compound of formula **1e** where  $R^2$  is either I or Br with an aryl or heteroaryl stannane compound of formula  $R^3-SnR_3$  in the presence of a palladium catalyst. In compounds of formula  $R^3-SnR_3$  the R group is a lower alkyl group such as butyl or methyl. The aryl or heteroaryl group of compound  $R^3-SnR_3$   
 20 can be substituted by groups including aryl and heteroaryl and also formyl, carboxylate, acetal, alkyl and alkylamino among others. The aryl or heteroaryl group of compound  $R^3-SnR_3$  can also be fused to a second aryl or heteroaryl group. For the addition of compounds of formula  $R^3-SnR_3$  the preferred palladium catalyst is bis(triphenylphosphine)palladium (II) chloride in a solvent such as dioxane.

25 Compounds of formula **1e** where  $R^2$  is an alkyne group can also be prepared by the route shown in Scheme 13. Treatment of a compound of formula **1e**, where  $R^2$  is either Br or I with (trimethylsilyl)acetylene in the presence of a palladium catalyst, preferably tetrakis(triphenylphosphine)palladium(0), with a catalytic amount of copper(I) iodine in a solvent system such as triethylamine and benzene, provides  
 30 compounds of formula **1e** where  $R^2$  is a 2-(trimethylsilyl)ethynyl group. Reaction of compounds of formula **1e** where  $R^2$  is a 2-(trimethylsilyl)ethynyl group with aryl iodides

or heteroaryl iodides in the presence of a palladium catalyst, preferably bis(triphenylphosphine)palladium(II)chloride, in the presence of triphenylphosphine, potassium carbonate and copper(I) iodide, in a solvent mixture of tetrahydrofuran and methanol, provides compounds of formula **1e** where  $R^2$  is a 2-(aryl)ethynyl or a 2-

5 (heteroaryl)ethynyl group. In addition the 2-(trimethylsilyl)ethynyl group can be cleaved by treatment with potassium carbonate in methanol to provide compounds of formula **1e** where  $R^2$  is an ethynyl group.

Scheme 13

- Scheme 14 depicts the preparation of key sulfone intermediate 30. Oxidation of 16 with an excess of an oxidizing agent such as m-chloroperbenzoic acid, peracetic acid or an oxaziridine provides the sulfone derivative 30. If both the sulfoxide and sulfone are obtained in the reaction, they can be separated by standard laboratory techniques. Addition of a compound of formula  $R^1XH$  where X is NH or  $NR^4$  to compound 30, in the presence of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of 110-130°C, or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of 60-70°C, provides compounds of formula **If** of the invention where where X is NH or  $NR^4$ .
- 10 Addition of a compound of formula  $R^1XH$ , where X is O, to compounds of formula 30, optionally with the addition of a base such as potassium carbonate in a solvent such as dimethylformamide at elevated temperature, provides compounds of formula **If** of the invention where X is O. Addition of a compound of formula  $R^1XH$ , where X is S, to compounds of formula 30, in a solvent such as dimethylformamide, provides
- 15 compounds of formula **If** of the invention where X is S. Addition of a compound of formula  $R^1XH$ , where X is  $NHCH_2$ , to compounds of formula 30, optionally with the addition of a base such as N,N-diisopropylamine in a solvent such as 2-ethoxyethanol at elevated temperature, provides compounds of formula **If** of the invention where X is  $NHCH_2$ .
- 20 Compounds of the invention of formula **If** where  $R^2$  is an alkene, alkyne, heteroaryl or aryl group can be prepared as depicted in Scheme 14 from compounds of formula **If** where  $R^2$  is either I or Br. Treatment of compounds of formula **If** where  $R^2$  is either I or Br with an alkene or alkyne of formula  $R^3-H$  in the presence of a palladium catalyst provides compounds of formula **If** where  $R^2$  is either an alkene or
- 25 alkyne group. This alkene or alkyne group can be substituted by groups including aryl and heteroaryl and also alkyl and alkylamino among others.

For the addition of alkenes of formula  $R^3-H$  the preferred palladium catalyst is palladium acetate in the presence of a ligand, preferably tri-*o*-tolylphosphine, in a solvent system that includes triethylamine or preferably a mixture of triethylamine and

30 N,N-dimethylformamide. For the addition of alkynes of formula  $R^3-H$  the preferred palladium catalyst is tetrakis(triphenylphosphine)palladium (0) along with a catalytic

amount of copper(I)iodide in a solvent mixture that includes triethylamine and benzene.

5 Treatment of compounds of formula If where  $R^2$  is either I or Br with an aryl or heteroaryl organoboron compound of formula  $R^3-BL^1L^2$  in the presence of a palladium catalyst provides compounds of formula If where  $R^2$  is either an aryl or heteroaryl group. In compounds of formula  $R^3-BL^1L^2$ , the  $L^1L^2$  groups represent ligands and include such groups as lower alkoxy or preferably hydroxy. The aryl or heteroaryl group of compound  $R^3-BL^1L^2$  can be substituted by groups including aryl and heteroaryl and also formyl, carboxylate, alkyl and alkylamino among others. The  
10 aryl or heteroaryl group of compound  $R^3-BL^1L^2$  can also be fused to a second aryl or heteroaryl group. For the addition of compounds of formula  $R^3-BL^1L^2$  the preferred palladium catalyst is tetrakis(triphenylphosphine)palladium (0) in a solvent mixture that includes saturated aqueous sodium bicarbonate and ethylene glycol dimethyl ether.

15 Compounds of formula If where  $R^2$  is either aryl or heteroaryl can also be prepared by reaction of a compound of formula If where  $R^2$  is either I or Br with an aryl or heteroaryl stannane compound of formula  $R^3-SnR_3$  in the presence of a palladium catalyst. In compounds of formula  $R^3-SnR_3$  the R group is a lower alkyl group such as butyl or methyl. The aryl or heteroaryl group of compound  $R^3-SnR_3$   
20 can be substituted by groups including aryl and heteroaryl and also formyl, carboxylate, acetal, alkyl and alkylamino among others. The aryl or heteroaryl group of compound  $R^3-SnR_3$  can also be fused to a second aryl or heteroaryl group. For the addition of compounds of formula  $R^3-SnR_3$  the preferred palladium catalyst is bis(triphenylphosphine)palladium (II) chloride in a solvent such as dioxane.

25 Compounds of formula If where  $R^2$  is an alkyne group can also be prepared by the route shown in Scheme 14. Treatment of a compound of formula If, where  $R^2$  is either Br or I with (trimethylsilyl)acetylene in the presence of a palladium catalyst, preferably tetrakis(triphenylphosphine)palladium(0), with a catalytic amount of copper(I) iodine in a solvent system such as triethylamine and benzene, provides  
30 compounds of formula If where  $R^2$  is a 2-(trimethylsilyl)ethynyl group. Reaction of compounds of formula If where  $R^2$  is a 2-(trimethylsilyl)ethynyl group with aryl iodines

or heteroaryl iodides in the presence of a palladium catalyst, preferably bis(triphenylphosphine)palladium(II)chloride, in the presence of triphenylphosphine, potassium carbonate and copper(I) iodide, in a solvent mixture of tetrahydrofuran and methanol, provides compounds of formula If where  $R^2$  is a 2-(aryl)ethynyl or a 2-  
5 (heteroaryl)ethynyl group. In addition the 2-(trimethylsilyl)ethynyl group can be cleaved by treatment with potassium carbonate in methanol to provide compounds of formula If where  $R^2$  is an ethynyl group.

Scheme 14

Alternate routes for the preparation of the key intermediate **29** and **30** are shown in Scheme 15. Oxidation of **15** with an oxidizing agent provides the sulfoxide **31** or the sulfone **32**. Excess amounts of oxidizing agent would be expected to provide the sulfone via an intermediate sulfoxide. Treatment of sulfoxide **31** with a base, preferentially lithium diisopropylamine (LDA), in an inert solvent such as tetrahydrofuran at reduced temperature, preferably  $-78^{\circ}\text{C}$ , followed by the addition of 1,2-dibromo-1,1,2,2-tetrafluoroethane provides **29** where LG = Br. Analogously, treatment of **31** with a base, preferentially lithium diisopropylamine (LDA), in an inert solvent such as tetrahydrofuran at reduced temperature, preferably  $-78^{\circ}\text{C}$ , followed by the addition of iodine provides **29** where LG = I. In a similar fashion, treatment of sulfone **32** with a base, preferentially lithium diisopropylamine (LDA), in an inert solvent such as tetrahydrofuran at reduced temperature, preferably  $-78^{\circ}\text{C}$ , followed by the addition of 1,2-dibromo-1,1,2,2-tetrafluoroethane provides **30** where LG = Br. Analogously, treatment of **32** with a base, preferentially lithium diisopropylamine (LDA), in an inert solvent such as tetrahydrofuran at reduced temperature, preferably  $-78^{\circ}\text{C}$ , followed by the addition of iodine provides **30** where LG = I.

Scheme 15

Additional compounds of the invention of formula **1a** where  $R^2$  is an alkenyl or alkynyl group can be prepared as depicted in Scheme 16. Treatment of intermediates **12** or **13** with an alkenyl or alkynyl reagent of formula  $R^3-H$  in the presence of a palladium catalyst provides intermediates of **33** where  $R^3$  is either an alkenyl or alkynyl group. This alkenyl or alkynyl group can be substituted by groups including aryl and heteroaryl and also alkyl and alkyl amino among others. This aryl or heteroaryl group can also be substituted by groups such as alkoxy, alkylamino and others. For the addition of alkenyls of formula  $R^3-H$  the preferred palladium catalyst is palladium acetate in the presence of a ligand, preferably tri-*o*-tolylphosphine, in a solvent system that includes triethylamine or preferably a mixture of triethylamine and *N,N*'-dimethylformamide. For the addition of alkynyls of formula  $R^3-H$  the preferred palladium catalyst is tetrakis(triphenylphosphine)palladium (0) along with a catalytic amount of copper(I)iodide in a solvent mixture that includes triethylamine and benzene. Addition of a compound of formula  $R^1NH_2$  to compounds of formula **33**, optionally with the addition of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of 110-130°C, or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of 60-70°C, or under palladium catalyzed coupling conditions, including the use of tris(dibenzylideneacetone)-dipalladium(0) and (2- dicyclohexylphosphino-2'-(*N,N*-dimethylamino)biphenyl, in a solvent such as ethylene glycol dimethyl ether at elevated temperatures such as 90°C provides compounds of formula **1a**.

Treatment of intermediates of formula **12** or **13** with an aryl or heteroaryl organoboron compound of formula  $R^3-BL^1L^2$  in the presence of a palladium catalyst provides intermediates of formula **33** where  $R^3$  is either an aryl or heteroaryl group. In compounds of formula  $R^3-BL^1L^2$ , the  $L^1L^2$  groups represent ligands and include such groups as lower alkoxy or preferably hydroxy. The aryl or heteroaryl group of compound  $R^3-BL^1L^2$  can be substituted by groups including aryl and heteroaryl and also formyl, carboxylate, alkyl and alkylamino among others. The aryl or heteroaryl group of compound  $R^3-BL^1L^2$  can also be fused to a second aryl or heteroaryl group. For the addition of compounds of formula  $R^3-BL^1L^2$  the preferred palladium catalyst is tetrakis(triphenylphosphine)palladium (0) in a solvent mixture that includes saturated aqueous sodium bicarbonate and ethylene glycol dimethyl ether. Addition of a compound of formula  $R^1NH_2$  to compounds of formula **33**, optionally with the addition

of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of 110-130°C, or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of 60-70°C, or under palladium catalyzed coupling conditions, including the use of tris(dibenzylideneacetone)-dipalladium(0) and (2-dicyclohexylphosphino-2'-(*N,N*-dimethylamino)biphenyl, in a solvent such as ethylene glycol dimethyl ether at elevated temperatures such as 90°C provides compounds of formula **1a**.

Compounds of formula **1a** where  $R^2$  is either aryl or heteroaryl can also be prepared by reaction of intermediates of formula **12** or **13** with an aryl or heteroaryl stannane compound of formula  $R^3-SnR_3$  in the presence of a palladium catalyst. In compounds of formula  $R^3-SnR_3$  the  $R$  group is a lower alkyl group such as butyl or methyl. The aryl or heteroaryl group of compound  $R^3-SnR_3$  can be substituted by groups including aryl and heteroaryl and also formyl, carboxylate, acetal, alkyl and alkylamino among others. The aryl or heteroaryl group of compound  $R^3-SnR_3$  can also be fused to a second aryl or heteroaryl group. For the addition of compounds of formula  $R^3-SnR_3$  the preferred palladium catalyst is bis(triphenylphosphine)palladium (II) chloride in a solvent such as dioxane. Addition of a compound of formula  $R^1NH_2$  to compounds of formula **33**, optionally with the addition of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of 110-130°C, or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of 60-70°C, or under palladium catalyzed coupling conditions, including the use of tris(dibenzylideneacetone)-dipalladium(0) and (2-dicyclohexylphosphino-2'-(*N,N*-dimethylamino)biphenyl, in a solvent such as ethylene glycol dimethyl ether at elevated temperatures such as 90°C provides compounds of formula **1a**.

Scheme 16

Some additional routes to the compounds of the invention of formula **1a** are shown in Scheme 17. Intermediates of formula **34** can be converted to intermediates of formula **35** via reductive amination with an amine of formula QH and a reducing agent, preferably sodium triacetoxyborohydride, in a solvent system that includes dichloromethane and N,N-dimethylformamide or 1-methyl-2-pyrrolidinone, optionally in the presence of acetic acid. Addition of a compound of formula  $R^1NH_2$  to compounds of formula **35**, optionally with the addition of pyridine hydrochloride in a solvent such as 2-ethoxyethanol at elevated temperatures of 110-130°C, or in the presence of sodium hydride in a solvent such as tetrahydrofuran at elevated temperatures of 60-70°C, or under palladium catalyzed coupling conditions, including the use of tris(dibenzylideneacetone)-dipalladium(0) and (2-dicyclohexylphosphino-2'-(N,N-dimethylamino)biphenyl, in a solvent such as ethylene glycol dimethyl ether at elevated temperatures such as 90°C provides compounds of formula **1a**.

Scheme 17

Additional compounds of the invention of formula **1a** where  $R^2$  is an alkenyl group can be prepared as depicted in Scheme 18 from reaction of compounds of formula **1a** where  $R^2$  is an alkynyl group with a heteroaryl compound containing an NH group in the ring. Such heteroaryl compounds include 1,2,3-triazole, imidazole, pyrrole and the like. The reaction is carried out in the presence of cesium hydroxide in a solvent such as 1-methyl-2-pyrrolidinone.

Scheme 18

Additional compounds of the invention of formula **1a** where  $R^2$  is a substituted heteroaryl group can be prepared as depicted in Scheme 19 from reaction of compounds of formula **1a** where  $R^3$  is heteroaryl group containing an NH group with a reagent of formula  $LG-(C(R^9)_2)_q-X-R^8$  or  $LG-(C(R^9)_2)_q-Q$ , wherein LG is a leaving group such as Cl, Br, I, mesylate or tosylate. Such reagents include 4-(2-chloroethyl)morpholine, 2-chloroethanol, 2-(dimethylamino)ethyl chloride and the like.

The heteroaryl group containing an NH group includes pyrazole, pyrrole and the like. The reaction is carried out in the presence of a base such as cesium carbonate in a solvent such as dimethylformamide at a slightly elevated temperature such as 50°C.

### Reference Example 1

#### 7-Oxo-4,7-dihydrothieno[3,2-b]pyridine-6-carbonitrile

A mixture of methyl 3-amino-2-thiophenecarboxylate (18.3 g, 116.5 mmol) and 80 mL of N,N-dimethylformamide dimethyl acetal is heated at reflux for 90 minutes. The reaction mixture is concentrated in vacuo resulting in a dark brown oil. This material is stirred with diethyl ether. Addition of hexane results in the formation of a small amount of brown solid, which is removed by filtration. Concentration of the filtrate provides 10.65 g of the intermediate amidine as a bright yellow oil.

To a solution of 40 mL of 2.5 M n-butyl lithium in tetrahydrofuran at -78°C is added acetonitrile (6.3 mL). After stirring for 10 min, a solution of the amidine in 100 mL of tetrahydrofuran is added dropwise over 40 minutes. The reaction mixture is stirred at -78°C for 2 hours, then 6.3 mL of acetic acid is added. The mixture is allowed to come to room temperature and stirring is continued overnight. The reaction mixture is concentrated in vacuo and the residue is partitioned between water and ethyl acetate. The organic layer is washed with water, dried over magnesium sulfate, filtered and concentrated in vacuo. The residue is heated at reflux in 60 mL of acetic acid for 3 hours then stirred at room temperature overnight. The reaction mixture is concentrated in vacuo and the crude product is purified by flash column chromatography eluting with a gradient of ethyl acetate to 10% methanol in ethyl acetate. A portion of the product is stirred with methanol and

The reaction mixture is cooled to room temperature and the dark solids are removed by filtration. The filtrate is poured into hexane and allowed to stand at room temperature. The solvent is decanted off and the residual oil is dissolved in ethyl acetate and the solution is washed with water. The organic layer is dried over 15 magnesium sulfate, filtered and passed through silica gel. The filtrate is concentrated in vacuo to give 770 mg of the desired product as a dark orange solid. A portion of this material is purified by flash column chromatography eluting with 1: 1 ethyl acetate : hexane to provide 7-chlorothieno[3,2-b]pyridine-6-carbonitrile as tan crystals, mp 110-111°C;  $^1\text{H}$  NMR (DMSO- $d_6$ )  $\delta$ 7.81 (d, J = 5 Hz, 1H), 8.59 (d, J = 5 20 Hz, 1H), 9.12 (s, 1H); MS 194.9 (M+H)+.

#### 4-[(3-Chloro-4-[(1-methyl-1H-imidazol-2-yl)thio]phenyl)amino]thieno[2,3-b]pyridine-5-carbonitrile

A mixture of (3-chloro-4-[(1-methyl-1H-imidazol-2-yl)sulfanyl]aniline (135 mg, 0.57 mmol), pyridine hydrochloride (66 mg, 0.57 mmol) and 4-chlorothieno[2,3-b]pyridine-5-carbonitrile (0.1 g, 0.52 mmol) in 4 mL of 2-ethoxyethanol is heated at reflux for 24 hours. The solution is cooled and the solvent is evaporated. The resultant residue is treated with a minimum amount of methanol and the product is purified by flash column chromatography eluting with 3% methanol in dichloromethane. The fractions containing product are combined and concentrated. Ethyl acetate is added and the insoluble material collected by filtration to provide 55 mg of 4-[(3-chloro-4-[(1-methyl-1H-imidazol-2-yl)thio]phenyl)amino]thieno[2,3-b]pyridine-5-carbonitrile as a tan solid, mp >240°C;  $^1H$  NMR (DMSO- $d_6$ )  $\delta$  3.61 (s, 3H), 6.53 (d, J = 9 Hz, 1H), 7.15 (m, 1H), 7.17 (s, 1H), 7.44 (m, 1H), 7.52 (s, 1H), 7.54 (s, 1H), 7.81 (d, J = 6 Hz, 1H), 8.53 (s, 1H), 9.76 (s, 1H); MS 396.2 (M-H)-.

7-[(4-Phenoxyphenyl)amino]-2-[(E)-2-pyridin-4-ylethenyl]thieno[3,2-b]pyridine-6-carbonitrile

A mixture of 2-bromo-7-[(4-phenoxyphenyl)amino]thieno[3,2-b]pyridine-6-carbonitrile (200 mg, 0.47 mmol), 4-vinylpyridine (79.7 mg, 0.75 mmol), palladium acetate (21.1 mg, 0.094 mmol) and tri-*o*-tolylphosphine (7.2 mg, 0.024 mmol) in 4 mL of N,N-dimethylformamide and 2.3 mL of triethylamine is heated at 125°C for 4 hours. After cooling to room temperature the reaction mixture is concentrated in vacuo and the residue is diluted with dichloromethane. The organic phase is washed with water and saturated aqueous sodium chloride, then dried over sodium sulfate, filtered and concentrated in vacuo.

The reaction is repeated a second time with the modification that the reaction mixture is now heated at 125°C for only 60 minutes. The crude products are combined and purified by thin layer preparative chromatography developing with 7% methanol in dichloromethane. A second thin layer preparative chromatography developing with 5% methanol in dichloromethane gives 16 mg of 7-[(4-phenoxyphenyl)amino]-2-[(E)-2-pyridin-4-ylethenyl]thieno[3,2-b]pyridine-6-carbonitrile

To a suspension of 2-(4-formylphenyl)-7-[2,4-dichloro-5-methoxyphenyl]amino]thieno[3,2-b]pyridine-6-carbonitrile (312 mg, 0.69 mmol) and 1.73 mL of 2 M dimethylamine in tetrahydrofuran (3.45 mmol) in 6.9 mL of dichloromethane and 1.7 mL of N,N-dimethylformamide at 0°C is added sodium triacetoxyborohydride (877 mg, 4.14 mmol). After stirring at 0°C for 5 minutes, 0.20 mL of acetic acid are added and the reaction mixture is allowed to warm to room temperature and stirred for 17 hours. The reaction is quenched by the addition of water and then partitioned between saturated aqueous sodium bicarbonate and dichloromethane. The organic layer is dried over sodium sulfate, filtered and concentrated in vacuo. The residue is purified by flash column chromatography developing with a gradient of from 1% to 10% methanol in dichloromethane to give a solid which is washed with hexane to provide 222 mg of 7-[(2,4-dichloro-5-methoxyphenyl)amino]-2-[4-[(dimethylamino)methyl]phenyl]thieno[3,2-b]pyridine-6 carbonitrile as a tan solid, mp 224-225°C; <sup>1</sup>H NMR (DMSO-*d*<sub>6</sub>) δ2.17 (s, 6H), 3.44 (s, 2H), 3.86 (s, 3H), 7.37 (s, 1H), 7.40 (d, J= 8 Hz, 2H), 7.68 (d, J= 8 Hz, 2H), 7.76 (s, 1H), 7.90 (s, 1H), 8.60 (s, 1H), 9.73 (s, 1H); MS 483.1, 485.1 (M+H)<sup>+</sup>.

- 5 Evaluation of representative compounds of this invention in several standard pharmacological test procedures indicated that the compounds of this invention possess significant antiproliferative activity and are inhibitors of protein tyrosine kinases. Based on the activity shown in the standard pharmacological test procedures, the compounds of this invention are therefore useful as antineoplastic agents. In particular, these compounds are useful in treating, inhibiting the growth of, or eradicating neoplasms such as those of the breast, kidney, bladder, mouth, larynx, esophagus, stomach, colon, ovary, lung, pancreas, liver, prostate and skin.

- In addition to having antineoplastic properties, the compounds of the present invention are expected to be useful in treating a variety of protein tyrosine kinase associated disorders including, but not limited to, osteoarthritis, restenosis, atherosclerosis, fibroplasia, angiofibromas, hemangiomas, diabetes, acute and chronic nephropathies, Kaposi's sarcoma, atheroma, neovascular glaucoma, neovascularization associated with macular degeneration, rheumatoid arthritis, psoriatic arthritis, transplant rejection, T-cell mediated hypersensitivity diseases, including gluten-sensitive enteropathy (Celiac disease), contact and delayed-type hypersensitivity, psoriasis, contact dermatitis, protection from ischemic or reperfusion injury such as that incurred during organ transplantation, stroke or myocardial infarction, transplantation tolerance induction, lupus, graft versus host disease, glomerulonephritis, serum sickness, respiratory and skin allergies, autoimmune alopecia, pernicious anemia, Hashimoto's thyroiditis, autoimmune hyperthyroidism, Addison's disease, multiple sclerosis, inflammatory bowel disease, acute inflammatory responses (for example acute respiratory distress syndrome), Behcet's disease, atopic dermatitis, systemic sclerosis and eczema.

The test procedures used and results obtained are shown below.

Rat2 fibroblasts stably transformed with a plasmid containing a CMV promoter controlled v-Src/Hu c-Src fusion gene in which the catalytic domain of human c-Src was inserted in place of the v-Src catalytic domain in the v-Src gene are used for the measurement of src dependent suspension growth. Ultra-low cluster plates (Costar # 3474) are seeded with 10,000 cells per well on Day 1. Compound is added in serial two-fold dilutions from 10 micromolar to 0.009 micromolar on Day 2 and MTS reagent (Promega) is added on Day 5 (100 microliters of MTS/medium mix + 100 microliters of medium already on the cells and the absorbance is measured at 490nm. The results are analyzed as follows to yield an IC<sub>50</sub> for proliferation (micromolar units) as follows: %inhibition = (Abs490 nm sample - blank)/(Abs490 nm no cmpd control - blank) X 100%. The results obtained for representative compounds of this invention are listed in Table 1. Multiple entries for a given compound indicate that it was tested multiple times.

#### Src Kinase Assay

- 5 Recombinant human Src enzyme was obtained from PanVera (P3044). Biotinylated peptide corresponding to residues 6 – 20 of Cdk1 was used as a substrate (Biotin-KVEKIGEGTYGVVYK-COOH). Homogeneous fluorescence resonance energy transfer kinase assays were performed using the europium/APC detection format (LANCE, Perkin Elmer). Src enzyme (10 ng) was mixed with biotinylated peptide
- 10 (final concentration 2  $\mu$ M), 50 mM Hepes (pH 7.5), 10 mM MgCl<sub>2</sub>, 20  $\mu$ g/ml BSA, 0.001% Brij-35 (Sigma), 100  $\mu$ M ATP, 1% DMSO. The kinase reaction was incubated for 70 min at 37°C. The reaction was stopped with EDTA at a final concentration of 30mM EDTA/25mM Hepes (pH 7.5)/10  $\mu$ g/ml BSA. The mixture was combined with Eu-labeled anti-phosphotyrosine antibody PT66 (Perkin Elmer, AD0068) and
- 15 Streptavidin Surelight-APC (Perkin Elmer, CR130-100) in 50 mM Hepes (pH 7.5)/ 20  $\mu$ g/ml BSA, and incubated for 30 min according to manufacturer's specifications. Fluorescence intensity at 665 nm was used to monitor the extent of the kinase reaction. Multiple entries for a given compound indicate that it was tested multiple times. The results obtained for representative compounds of this invention are listed
- 20 in Table 3.

#### Raf/Mek Kinase Cascade Assay

Raf-1 (c-Raf) is used to phosphorylate and activate inactive GST-MEK1 which then can phosphorylate and activate inactive p42 GST-MAPK, which subsequently is measured for phosphorylation of the TEY sequence (aa's 202-204) by a phospho-specific antibody from Sigma (cat. # 77439219041) Reagents: Sf9 insect cell lysate containing full length 6his-tagged recombinant human c-Raf. (Specific Activity: ~200U/ml). Human Non-active Mek-1-GST and human GST-MAP kinase (recombinant proteins produced in *E. coli*).

#### Stock Solutions Raf/Mek cascade Assay:

1. Assay Dilution Buffer (ADB): 20mM MOPS, pH 7.2, 25mM  $\beta$ -glycerol phosphate, 5mM EGTA, 1mM sodium orthovanadate, 1mM dithiothreitol.
2. Magnesium/ATP Cocktail: 500 $\mu$ M cold ATP and 75 mM magnesium chloride in ADB.
4. Active Kinase: Human Active c-Raf: Use at 0.4U per assay point.
5. Non-active GST-MEK1: Use at 0.1 $\mu$ g per assay point.
6. Non-active GST-p42 MAP Kinase: Use at 1.0  $\mu$ g per assay point.

#### Stock Solutions ELISA:

1. TBST - Tris (50 mM, pH 7.5), NaCl (150 mM), Tween-20 (0.05 %)

2. Superblock (Pierce)
3. Anti-GST Ab (Pharmacia)
4. Anti-Phospho MAPK (Sigma)
5. Anti-Mouse Ab / Europium conjugate (Wallac)

5

#### Assay Procedure:

##### First Stage: c-Raf Dependent Activation of GST-MEK and GST-MAPK

1. Add 20 ml of ADB per assay (i.e. per well of a 96 well plate)
2. Add 10 ml of 0.5 mM cold ATP and 75 mM magnesium chloride in ADB.
- 10 3. Add 2 ml of c-Raf (0.4U/assay), in conjunction with 1.6ml non-active MEK1 (0.4 mg/assay).
4. Add 4 ml of non-active GST-p42 MAP Kinase (1.0 mg/assay).
5. Incubate for 60 minutes at 30°C in a shaking incubator.
6. Transfer this mixture to an anti-GST Ab coated 96 well plate (Nunc Immunosorb
- 15 plates coated o/n with a-GST, then blocked with Pierce Superblock).
7. Incubate for 60 minutes at 30°C in a shaking incubator
- Wash 3X with TBST, add Anti-Phospho MAPK (Sigma) (1:3000)
6. Incubate for 60 minutes at 30°C in a shaking incubator
7. Wash 3X with TBST, add Anti-Mouse Ab / Europium conjugate (Wallac) (1:500)
- 20 8. Incubate for 60 minutes at 30°C in a shaking incubator
9. Wash 3X with TBST, Read plates in Wallac Victor model Plate Reader.
10. Collect data analyze in Excel for single point and IC50 determinations.

- Single point assay - % inhibition at 10 mg/ml (% Inhibition = 1 - cpd.treated sample/untreated control). IC<sub>50</sub> determinations - done on compounds from single
- 25 point assays with >80% inhibition. Typically, the Raf/Mek assay is run at compound concentrations from 10 µM to 1 nM in half log dilutions. (% inhibition is determined for each compound concentration). . Multiple entries for a given compound indicate that it was tested multiple times. The results obtained measure Raf and/or Mek
- 30 kinase inhibition, and for representative compounds of this invention are listed in Table 4.

Cell Based Screen for Inhibitors of Raf and/or Mek Kinase.

## Materials

Cell Lines: Human tumor cell lines LoVo which are known to be growth inhibited by low nM concentrations of a reference standard inhibitor of *Ras* and human adenocarcinoma cell line CaCo-2, which is known to be growth resistant to the same reference compound.

Cell Media : RPMI 1640 with 10% Fetal Bovine Serum supplemented with L-glutamine and Pennicilin/Streptomycin.

Compounds: Supplied usually as a 10 mM stock in 100% DMSO.

10 Normal Saline: 150 mM NaCl

Trichloroacetic Acid (TCA): 50% (w/v) in water

Sulforhodamine B (SRB): 0.4% (w/v) in 1% Acetic Acid

Tris Base: 10 mM in water

## Methods

15 Cells are plated at 2000 cells per well for cell line LoVo, 1,750 cells for cell line BXPC3, 1,000 cells for cell line WM266-4 and 1500 cells for cell line CaCo-2 in 96 well plates. Cells are plated in media (200  $\mu$ l) and allowed to adhere overnight at 37°C. At 24 hours post plating, compounds are added directly at a volume of 0.5  $\mu$ l. For the qualitative screen (compounds screened at 25  $\mu$ M)

20 compound is added directly to cells. For the quantitative screen, compound is first diluted in DMSO to generate concentrations of compound or reference standard of: 1, 5, 10 and 25  $\mu$ M. It is advisable to make the dilutions in an identical 96 well plate so that compounds can be added using a multichannel micropipettor set at 0.5  $\mu$ l. The cells are then incubated for four days after

25 which the media is removed using a 12 well manifold by first tipping the plate forward at a 45 degree angle and then inserting the manifold in an upright orientation to prevent the tips of the manifold from disturbing cells at the bottom of the plate. 200  $\mu$ l of normal saline is then added to each well using an 8 well multichannel pipettor, followed by the careful addition of 50  $\mu$ l of 50% TCA. The

30 plates are then incubated for 2 hours at 4°C, after which the supernatant is removed using the same technique as above and the plates washed twice with 200  $\mu$ l water. The plates are then air dried and 50  $\mu$ l of SRB stock solution is carefully added so that the entire bottom of each well is covered. This again

can be used using an 8 well multichannel pipettor. The SRB is incubated with fixed cells for 15 minutes at room temperature after which the SRB is removed with the manifold as described above and the plates washed twice with 350  $\mu$ l of 1% acetic acid per well each time. The plates are then air dried after which

5 the bound SRB is released from protein by the addition of 200  $\mu$ l of Tris base. Resolubilizing the SRB is aided by placing the plates on a rotator for 15-30 minutes. The absorbance of each well is determined at 550 or 562 nm using a microtiter plate reader.

Each compound or dilution thereof is performed in triplicate. Outliers are

10 identified by visual inspection of the data. Each plate should have a "0" control (vehicle only).

Qualitative screen: To calculate % inhibition of a compound at 25  $\mu$ M, the following formula is used:  $1 - (\text{experimental absorbance @ 25 } \mu\text{M compound} / \text{"0" control absorbance}) \times 100 = \% \text{ inhibition at 25 } \mu\text{M}$ . Compounds having >50%

15 inhibition at 25  $\mu$ M are placed in the quantitative assay.

Quantitative Assay: A standard curve is constructed by plotting the concentration of compound against the average absorbance calculated at that concentration. A curve is plotted and the concentration at which the curve passes through the 50% the absorbance mark seen in the "0" control well is the  $IC_{50}$

20 calculated for that compound. Multiple entries for a given compound indicate that it was tested multiple times. The results obtained for representative compounds of this invention are listed in Table 4.
